# Data Mining Classification: Alternative Techniques

# **Bayesian Classifiers**

Introduction to Data Mining, 2<sup>nd</sup> Edition by Tan, Steinbach, Karpatne, Kumar

### **Bayes Classifier**

- A probabilistic framework for solving classification problems
- Conditional Probability:  $P(Y | X) = \frac{P(X,Y)}{P(X)}$ 
  - $P(X \mid Y) = \frac{P(X,Y)}{P(Y)}$
- Bayes theorem:

$$P(Y \mid X) = \frac{P(X \mid Y)P(Y)}{P(X)}$$

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

#### **Example of Bayes Theorem**

- Given:
  - A doctor knows that meningitis causes stiff neck 50% of the time
  - Prior probability of any patient having meningitis is 1/50,000
  - Prior probability of any patient having stiff neck is 1/20
- If a patient has stiff neck, what's the probability he/she has meningitis?

$$P(M \mid S) = \frac{P(S \mid M)P(M)}{P(S)} = \frac{0.5 \times 1/50000}{1/20} = 0.0002$$

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

3

### **Using Bayes Theorem for Classification**

- Consider each attribute and class label as random variables
- Given a record with attributes (X<sub>1</sub>, X<sub>2</sub>,..., X<sub>d</sub>)
  - Goal is to predict class Y
  - Specifically, we want to find the value of Y that maximizes P(Y| X<sub>1</sub>, X<sub>2</sub>,..., X<sub>d</sub>)
- Can we estimate P(Y| X<sub>1</sub>, X<sub>2</sub>,..., X<sub>d</sub>) directly from data?

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

# **Example Data**

#### **Given a Test Record:**

$$X = (Refund = No, Divorced, Income = 120K)$$

Tid	Refund	Marital Status	Taxable Income	Evade
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes

Can we estimate

P(Evade = Yes | X) and P(Evade = No | X)?

In the following we will replace

Evade = Yes by Yes, and

Evade = No by No

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

5

# **Using Bayes Theorem for Classification**

- Approach:
  - compute posterior probability  $P(Y \mid X_1, X_2, ..., X_d)$  using the Bayes theorem

$$P(Y | X_1 X_2 ... X_n) = \frac{P(X_1 X_2 ... X_d | Y) P(Y)}{P(X_1 X_2 ... X_d)}$$

- Maximum a-posteriori: Choose Y that maximizes  $P(Y \mid X_1, X_2, ..., X_d)$
- Equivalent to choosing value of Y that maximizes  $P(X_1, X_2, ..., X_d|Y) P(Y)$
- How to estimate  $P(X_1, X_2, ..., X_d | Y)$ ?

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

### **Example Data**

#### Given a Test Record:

$$X = (Refund = No, Divorced, Income = 120K)$$

Tid	Refund	Marital Status	Taxable Income	Evade
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes

#### **Using Bayes Theorem:**

$$P(Yes \mid X) = \frac{P(X \mid Yes)P(Yes)}{P(X)}$$

$$\square P(No \mid X) = \frac{P(X \mid No)P(No)}{P(X)}$$

□ How to estimate P(X | Yes) and P(X | No)?

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

7

# **Naïve Bayes Classifier**

- Assume independence among attributes X<sub>i</sub> when class is given:
  - $\ P(X_1, \, X_2, \, ..., \, X_d \, | Y_j) = P(X_1 | \, Y_j) \, P(X_2 | \, Y_j) ... \, P(X_d | \, Y_j)$
  - Now we can estimate P(X<sub>i</sub>| Y<sub>j</sub>) for all X<sub>i</sub> and Y<sub>j</sub> combinations from the training data
  - New point is classified to  $Y_j$  if  $P(Y_j) \prod P(X_i|Y_j)$  is maximal.

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

### **Conditional Independence**

- X and Y are conditionally independent given Z if P(X|YZ) = P(X|Z)
- Example: Arm length and reading skills
  - Young child has shorter arm length and limited reading skills, compared to adults
  - If age is fixed, no apparent relationship between arm length and reading skills
  - Arm length and reading skills are conditionally independent given age

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

9

### **Naïve Bayes on Example Data**

#### Given a Test Record:

$$X = (Refund = No, Divorced, Income = 120K)$$

Tid	Refund	Marital Status	Taxable Income	Evade
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes

P(X | Yes) =

P(Refund = No | Yes) x

P(Divorced | Yes) x

P(Income = 120K | Yes)

P(X | No) =

P(Refund = No | No)x

P(Divorced | No) x

P(Income = 120K | No)

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

#### **Estimate Probabilities from Data**

Tid	Refund	Marital Status	Taxable Income	Evade
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes

- Class:  $P(Y) = N_c/N$ 
  - e.g., P(No) = 7/10, P(Yes) = 3/10
- For categorical attributes:

$$P(X_i \mid Y_k) = |X_{ik}|/N_{c_k}$$

- where |X<sub>ik</sub>| is number of instances having attribute value X<sub>i</sub> and belonging to class Y<sub>k</sub>
- Examples:

P(Status=Married|No) = 4/7 P(Refund=Yes|Yes)=0

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

11

#### **Estimate Probabilities from Data**

- For continuous attributes:
  - Discretization: Partition the range into bins:
    - Replace continuous value with bin value
      - Attribute changed from continuous to ordinal
  - Probability density estimation:
    - Assume attribute follows a normal distribution
    - Use data to estimate parameters of distribution (e.g., mean and standard deviation)
    - Once probability distribution is known, use it to estimate the conditional probability P(X<sub>i</sub>|Y)

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

#### **Estimate Probabilities from Data**

Tid	Refund	Marital Status	Taxable Income	Evade
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes

Normal distribution:

$$P(X_i | Y_j) = \frac{1}{\sqrt{2\pi\sigma_{ij}^2}} e^{-\frac{(X_i - \mu_{ij})^2}{2\sigma_{ij}^2}}$$

- One for each (X<sub>i</sub>,Y<sub>i</sub>) pair
- For (Income, Class=No):
  - If Class=No
    - ◆ sample mean = 110
    - ◆ sample variance = 2975

$$P(Income = 120 \mid No) = \frac{1}{\sqrt{2\pi}(54.54)}e^{\frac{(120-110)^2}{2(2975)}} = 0.0072$$

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

13

# **Example of Naïve Bayes Classifier**

#### Given a Test Record:

$$X = (Refund = No, Divorced, Income = 120K)$$

#### Naïve Bayes Classifier:

P(Refund = Yes | No) = 3/7P(Refund = No | No) = 4/7

P(Refund = Yes | Yes) = 0 P(Refund = No | Yes) = 1

P(Marital Status = Single | No) = 2/7

P(Marital Status = Divorced | No) = 1/7 P(Marital Status = Married | No) = 4/7

P(Marital Status = Single | Yes) = 2/3 P(Marital Status = Divorced | Yes) = 1/3 P(Marital Status = Married | Yes) = 0

For Taxable Income:

If class = No: sample mean = 110 sample variance = 2975 If class = Yes: sample mean = 90

sample variance = 25

Since P(X|No)P(No) > P(X|Yes)P(Yes) Therefore P(No|X) > P(Yes|X) => Class = No

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

#### **Example of Naïve Bayes Classifier**

#### Given a Test Record:

X = (Refund = No, Divorced, Income = 120K)

#### Naïve Bayes Classifier:

$$\begin{split} & \text{P(Refund = Yes \mid No) = 3/7} \\ & \text{P(Refund = No \mid No) = 4/7} \\ & \text{P(Refund = Yes \mid Yes) = 0} \\ & \text{P(Refund = No \mid Yes) = 1} \\ & \text{P(Marital Status = Single \mid No) = 2/7} \\ & \text{P(Marital Status = Divorced \mid No) = 1/7} \\ & \text{P(Marital Status = Married \mid No) = 4/7} \\ & \text{P(Marital Status = Single \mid Yes) = 2/3} \\ & \text{P(Marital Status = Divorced \mid Yes) = 1/3} \\ & \text{P(Marital Status = Divorced \mid Yes) = 1/3} \\ & \text{P(Marital Status = Married \mid Yes) = 0} \\ \end{split}$$

For Taxable Income: If class = No: sample mean = 110 sample variance = 2975 If class = Yes: sample mean = 90

sample variance = 25

P(Yes) = 3/10P(No) = 7/10

P(Yes | Divorced) = 1/3 x 3/10 / P(Divorced)P(No | Divorced) = 1/7 x 7/10 / P(Divorced)

P(Yes | Refund = No, Divorced) = 1 x 1/3 x 3/10 /
P(Divorced, Refund = No)

P(No | Refund = No, Divorced) = 4/7 x 1/7 x 7/10 /

P(No | Refund = No, Divorced) =  $4/7 \times 1/7 \times 7/10$  / P(Divorced, Refund = No)

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

15

### **Issues with Naïve Bayes Classifier**

#### Naïve Bayes Classifier:

P(Refund = Yes | No) = 3/7
P(Refund = No | No) = 4/7
P(Refund = Yes | Yes) = 0
P(Refund = No | Yes) = 1
P(Marital Status = Single | No) = 2/7
P(Marital Status = Divorced | No) = 1/7
P(Marital Status = Married | No) = 4/7
P(Marital Status = Single | Yes) = 2/3
P(Marital Status = Divorced | Yes) = 1/3

P(Marital Status = Married | Yes) = 0

P(Yes) = 3/10P(No) = 7/10

P(Yes | Married) = 0 x 3/10 / P(Married)
 P(No | Married) = 4/7 x 7/10 / P(Married)

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

### **Issues with Naïve Bayes Classifier**

#### Taxable Status Income Yes Single 125K No Married 100K No Nο 70K 3 No Single Νo 120K No Yes Married Divorced 95K Yes Nο 60K Married No Single 85K 9 No Married 75K No No 90K 10 Single

#### Naïve Bayes Classifier:

Given X = (Refund = Yes, Divorced, 120K)  

$$P(X \mid No) = 2/6 \times 0 \times 0.0083 = 0$$

 $P(X \mid Yes) = 0 \times 1/3 \times 1.2 \times 10^{-9} = 0$ 

Naïve Bayes will not be able to classify X as Yes or No!

02/14/2018

Introduction to Data Mining, 2nd Edition

17

### **Issues with Naïve Bayes Classifier**

- If one of the conditional probabilities is zero, then the entire expression becomes zero
- Need to use other estimates of conditional probabilities than simple fractions
   c: number of classes
- Probability estimation:

p: prior probability of the class

Original:  $P(A_i \mid C) = \frac{N_{ic}}{N_c}$ 

m: parameter

Laplace:  $P(A_i \mid C) = \frac{N_{ic} + 1}{N_c + c}$ 

 $N_c$ : number of instances in the class

m - estimate :  $P(A_i \mid C) = \frac{N_{ic} + mp}{N_c + m}$ 

 $N_{ic}$ : number of instances having attribute value  $A_i$  in class c

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

### **Example of Naïve Bayes Classifier**

Name	Give Birth	Can Fly	Live in Water	Have Legs	Class
human	yes	no	no	yes	mammals
python	no	no	no	no	non-mammals
salmon	no	no	yes	no	non-mammals
whale	yes	no	yes	no	mammals
frog	no	no	sometimes	yes	non-mammals
komodo	no	no	no	yes	non-mammals
bat	yes	yes	no	yes	mammals
pigeon	no	yes	no	yes	non-mammals
cat	yes	no	no	yes	mammals
leopard shark	yes	no	yes	no	non-mammals
turtle	no	no	sometimes	yes	non-mammals
penguin	no	no	sometimes	yes	non-mammals
porcupine	yes	no	no	yes	mammals
eel	no	no	yes	no	non-mammals
salamander	no	no	sometimes	yes	non-mammals
gila monster	no	no	no	yes	non-mammals
platypus	no	no	no	yes	mammals
owl	no	yes	no	yes	non-mammals
dolphin	yes	no	yes	no	mammals
eagle	no	yes	no	ves	non-mammals

A: attributes

M: mammals

N: non-mammals

$$P(A \mid M) = \frac{6}{7} \times \frac{6}{7} \times \frac{2}{7} \times \frac{2}{7} = 0.06$$

$$P(A \mid N) = \frac{1}{13} \times \frac{10}{13} \times \frac{3}{13} \times \frac{4}{13} = 0.0042$$

$$P(A|M)P(M) = 0.06 \times \frac{7}{20} = 0.021$$

$$P(A|N)P(N) = 0.004 \times \frac{13}{20} = 0.0027$$

Give Birth	Can Fly	Live in Water	Have Legs	Class
yes	no	yes	no	?

P(A|M)P(M) > P(A|N)P(N)

=> Mammals

Introduction to Data Mining, 2<sup>nd</sup> Edition

19

### **Naïve Bayes (Summary)**

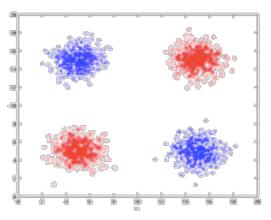

- Robust to isolated noise points
- Handle missing values by ignoring the instance during probability estimate calculations
- Robust to irrelevant attributes
- Independence assumption may not hold for some attributes
  - Use other techniques such as Bayesian Belief Networks (BBN)

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

• How does Naïve Bayes perform on the following dataset?

Conditional independence of attributes is violated

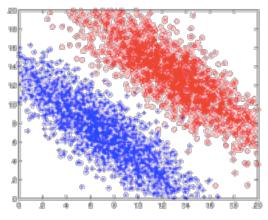

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

21

# **Naïve Bayes**

• How does Naïve Bayes perform on the following dataset?

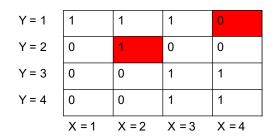

Naïve Bayes can construct oblique decision boundaries

Introduction to Data Mining, 2<sup>nd</sup> Edition

# **Naïve Bayes**

How does Naïve Bayes perform on the following dataset?

Conditional independence of attributes is violated

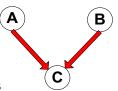

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

23

# **Bayesian Belief Networks**

- Provides graphical representation of probabilistic relationships among a set of random variables
- Consists of:
  - A directed acyclic graph (dag)
    - Node corresponds to a variable
    - Arc corresponds to dependence relationship between a pair of variables

 A probability table associating each node to its immediate parent

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

# **Conditional Independence**

D is parent of C

A is child of C

B is descendant of D

D is ancestor of A

 A node in a Bayesian network is conditionally independent of all of its nondescendants, if its parents are known

25

# **Conditional Independence**

Naïve Bayes assumption:

02/14/2018

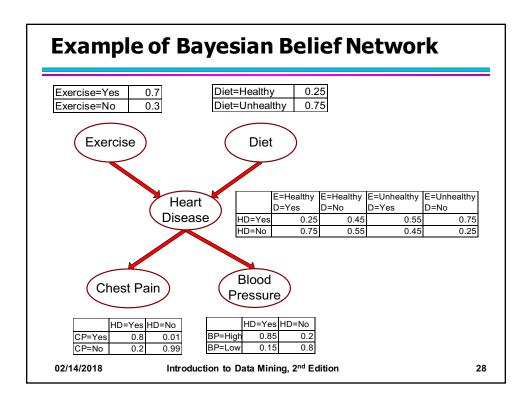

Introduction to Data Mining, 2<sup>nd</sup> Edition

### **Probability Tables**

- If X does not have any parents, table contains prior probability P(X)
- If X has only one parent (Y), table contains conditional probability P(X|Y)
- If X has multiple parents (Y<sub>1</sub>, Y<sub>2</sub>,..., Y<sub>k</sub>), table contains conditional probability P(X|Y<sub>1</sub>, Y<sub>2</sub>,..., Y<sub>k</sub>)

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition

# **Example of Inferencing using BBN**

- Given: X = (E=No, D=Yes, CP=Yes, BP=High)
  - Compute P(HD|E,D,CP,BP)?
- P(HD=Yes| E=No,D=Yes) = 0.55
   P(CP=Yes| HD=Yes) = 0.8
   P(BP=High| HD=Yes) = 0.85
  - P(HD=Yes|E=No,D=Yes,CP=Yes,BP=High)  $\propto 0.55 \times 0.8 \times 0.85 = 0.374$
- P(HD=No|E=No,D=Yes) = 0.45
   P(CP=Yes|HD=No) = 0.01
   P(BP=High|HD=No) = 0.2
  - P(HD=No|E=No,D=Yes,CP=Yes,BP=High)  $\propto 0.45 \times 0.01 \times 0.2 = 0.0009$

Classify X as Yes

02/14/2018

Introduction to Data Mining, 2<sup>nd</sup> Edition
