where  $\varphi_{i,i}$  and  $\psi_{i,k}$

Wavelet Tran

Steady-Sate Index

$$T_s = \sigma_{W_f}, \quad T_u = 3\lambda_2 \sigma_{W_f}, \quad T_w = \sigma_{WW_f}$$

SS index is defined according to the following rules:

- if  $|W_S f(t)| > T_u$  then  $\beta(t) = 0$ , where  $T_u$  is the identification WT modulus threshold for unsteady status;
- if  $|W_S f(t - \Delta t)| < T_s$  then  $\beta(t) = 1$ , where  $T_s$  is the identification WT modulus threshold for steady status, and  $\Delta t$  a long enough time interval to identify SS;
- to detect zero-crossing points, the second order WT is used. If  $|W_S f(t)| < T_s$  and  $|WW_S f(t)| < T_w$  then  $\beta(t) = 1$  where  $T_w$  is the second-order WT modulus threshold to identify zero-crossing point in the WT.

$$\beta(t) = \xi[\theta(t)]$$

$$\theta(t) = |W_S f(t)| + \gamma |WW_S f(t)|$$

$$\gamma = \begin{cases} 0 & |WW_S f| \leq T_w \\ (|WW_S f| - T_w)/2T_w & |WW_S f| \in ]T_w, 3T_w[ \\ 1 & |WW_S f| \geq 3T_w \end{cases}$$

$$\beta(t) = \begin{cases} 0 & \theta(t) \geq T_u \\ \xi[\theta(t)] & T_s < \theta(t) < T_u \\ 1 & \theta(t) \leq T_s \end{cases}$$

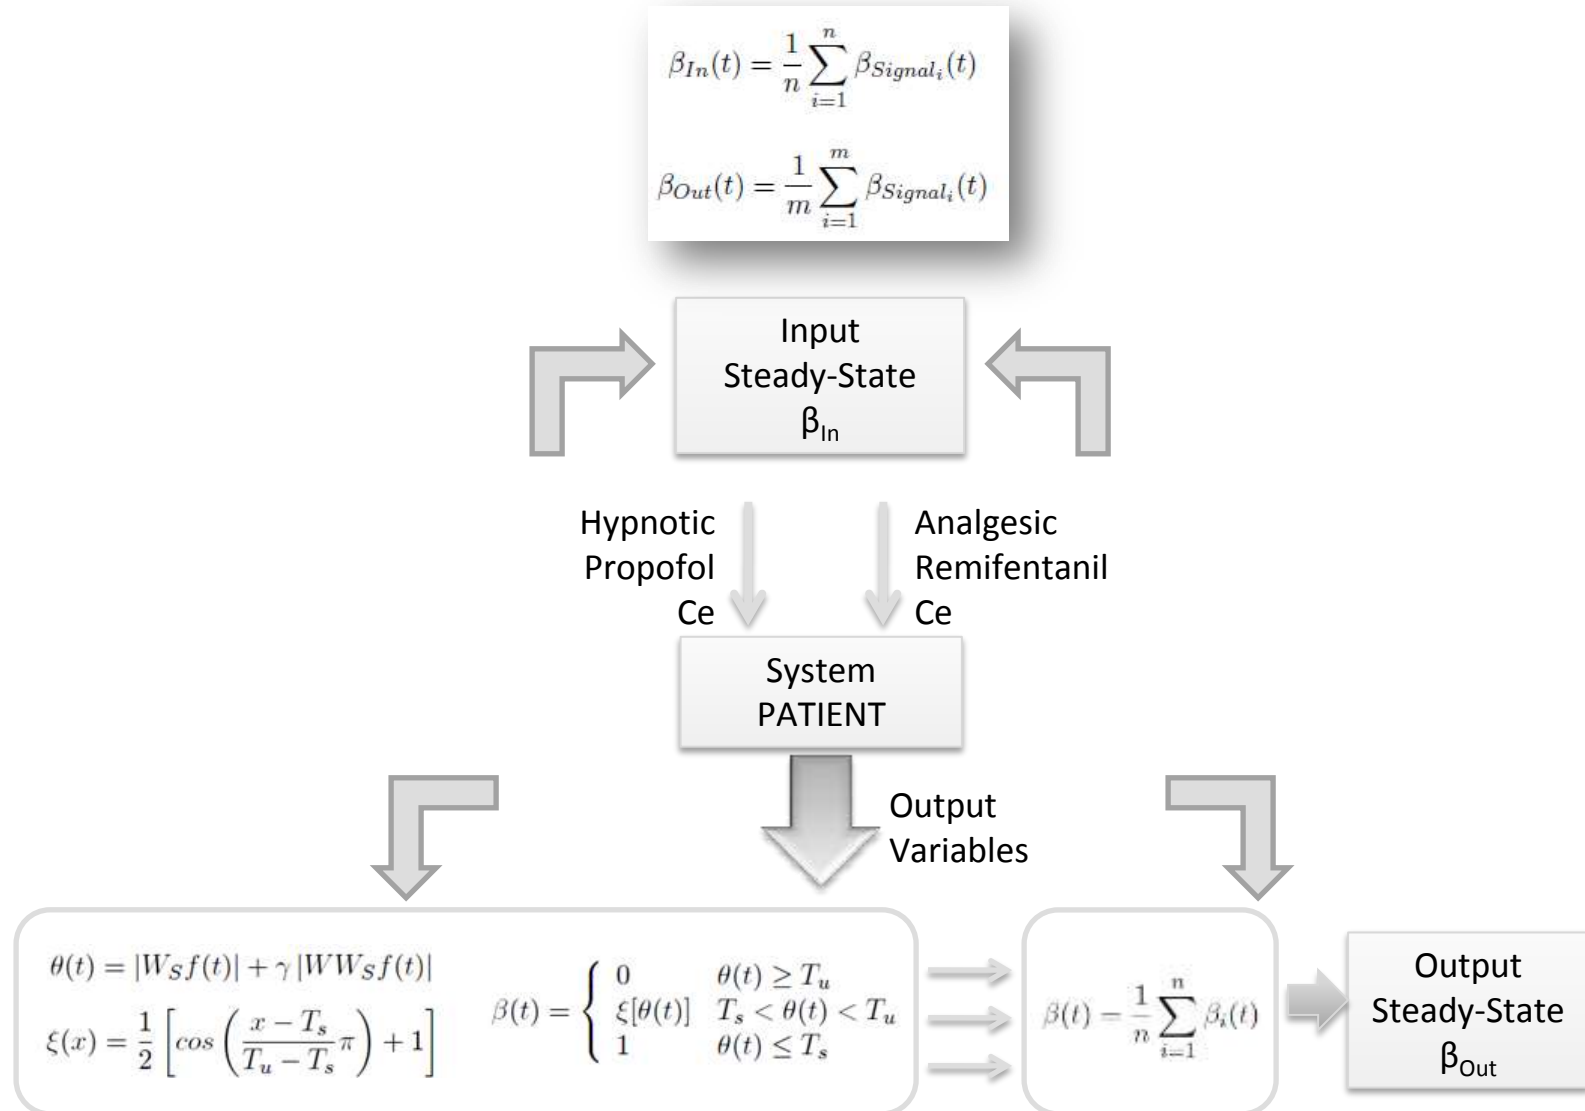

$$\xi(x) = \frac{1}{2} \left[ \cos \left( \frac{x - T_s}{T_u - T_s} \pi \right) + 1 \right]$$

# Monitoring System — Homeostasis Index and Perceived Stimulus Estimator

# ***Evoked Potentials***

***Active Nociception Measures***

# Introduction

The nociceptive signal is transmitted over small diameter A- $\delta$  and C-fibers in the dorsal horn, via the dorsal root ganglion.

Second order neurons relay the signal to the thalamus via the spinothalamic tract.

Third order neurons project from the thalamus to the primary sensory cortex where conscious perception of pain occurs.

 PT – Painful Threshold

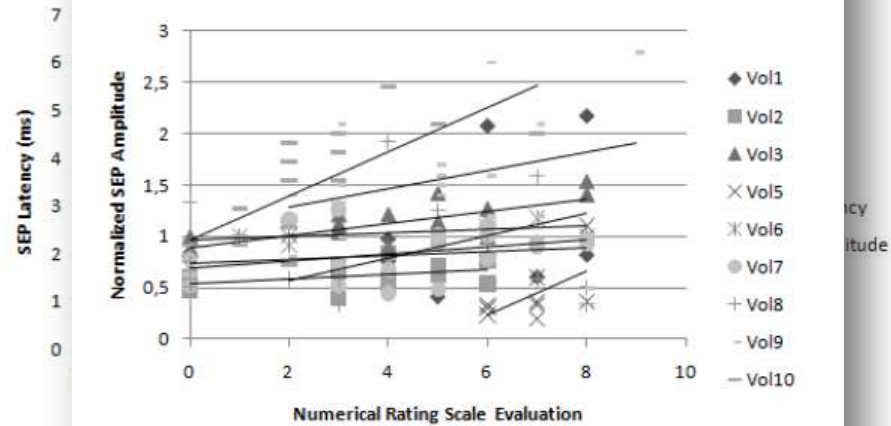

# Results and Discussion

(a) Original SEP Amplitude

(b) Normalized SEP Amplitude

## Baseline Normalization

$$SEP_{Amp_{Norm}} = \frac{SEP_{Amp}}{SEP_{Amp_0}}$$

where  $SEP_{Amp}$  is the observed SEP amplitude and  $SEP_{Amp_0}$  is the SEP amplitude for the PT stimulus without drugs in the system.

$$R = \frac{SEP_{Amp}}{SEPLat}$$

where  $SEPLat$  is the SEP latency, and

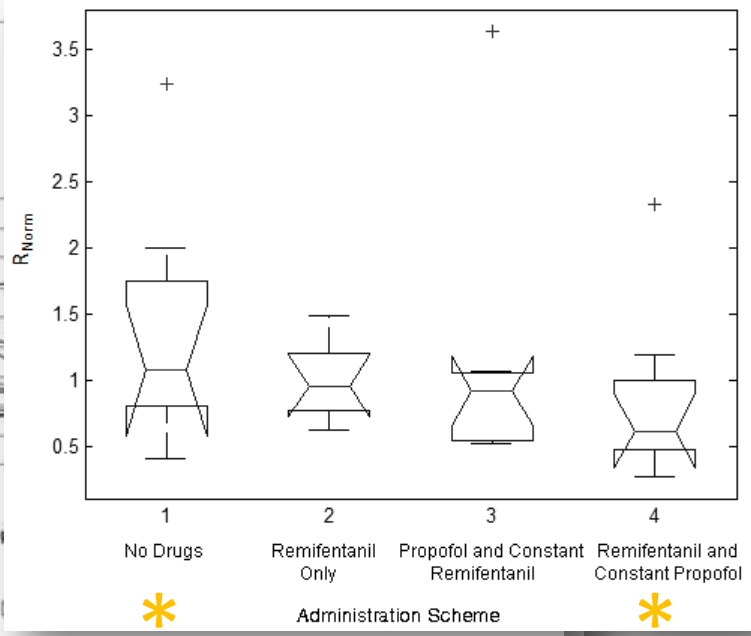

$$R_{Norm} = \frac{SEP_{Amp_{Norm}}}{SEPLat_{Norm}}$$

where  $SEPLat_{Norm}$  is the normalized latency by the observed latency to the PT prior drug administration ( $SEPLat_0$ )

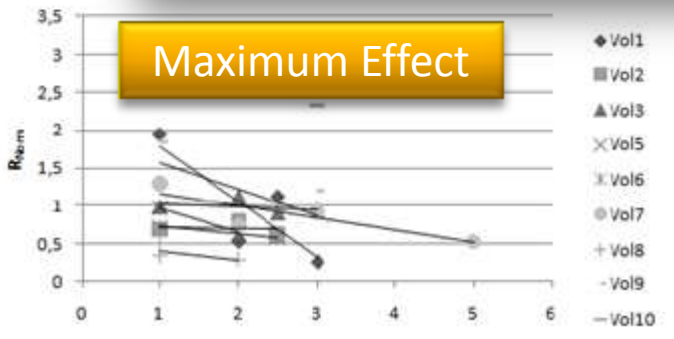

$$SEPLat_{Norm} = \frac{SEPLat}{SEPLat_0}$$

# Nociception Control

# ***Conclusions***

# Conclusions

- Why is nociception monitoring important?
  - Patient wellbeing
  - Unable to communicate patients
  - Post-operative persistent/chronic pain
  - Long-term effects of anesthetics
  - Titrate the anesthesia triad
  - Automatic control of anesthesia
