## Exercise: Distances

Sep 26th, 2018
Deadline: Oct 1st, 2018

Table 1 shows counters for different species of plants in different sites (s1...s30). Calculate the distances among the pairs of sites (e.g., (s1,s2), etc) using the distance metrics:

- Euclidean
- Minkowski
- Mahalonobis
- Bray-Curtis index
- Chi-square

| SITE | SPECIES COUNTS |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | $a$ | $b$ | c | d | e |
| s1 | 0 | 2 | 9 | 14 | 2 |
| s2 | 26 | 4 | 13 | 11 | 0 |
| s3 | 0 | 10 | 9 | 8 | 0 |
| s4 | 0 | 0 | 15 | 3 | 0 |
| s5 | 13 | 5 | 3 | 10 | 7 |
| s6 | 31 | 21 | 13 | 16 | 5 |
| s7 | 9 | 6 | 0 | 11 | 2 |
| s8 | 2 | 0 | 0 | 0 | 1 |
| s9 | 17 | 7 | 10 | 14 | 6 |
| s10 | 0 | 5 | 26 | 9 | 0 |
| s11 | 0 | 8 | 8 | 6 | 7 |
| s12 | 14 | 11 | 13 | 15 | 0 |
| s13 | 0 | 0 | 19 | 0 | 6 |
| s14 | 13 | 0 | 0 | 9 | 0 |
| s15 | 4 | 0 | 10 | 12 | 0 |
| s16 | 42 | 20 | 0 | 3 | 6 |
| s17 | 4 | 0 | 0 | 0 | 0 |
| s18 | 21 | 15 | 33 | 20 | 0 |
| s19 | 2 | 5 | 12 | 16 | 3 |
| s20 | 0 | 10 | 14 | 9 | 0 |
| s21 | 8 | 0 | 0 | 4 | 6 |
| s22 | 35 | 10 | 0 | 9 | 17 |
| s23 | 6 | 7 | 1 | 17 | 10 |
| s24 | 18 | 12 | 20 | 7 | 0 |
| s25 | 32 | 26 | 0 | 23 | 0 |
| s26 | 32 | 21 | 0 | 10 | 2 |
| s27 | 24 | 17 | 0 | 25 | 6 |
| s28 | 16 | 3 | 12 | 20 | 2 |
| s29 | 11 | 0 | 7 | 8 | 0 |
| s30 | 24 | 37 | 5 | 18 | 1 |

Table 1: species counters
(Source: http://www.econ.upf.edu/~michael/stanford/Stanford Week1.pdf)

Rank the pairs of instances according to the measured distances. Plot the similarities for each distance used.

What can you conclude?
Is it possible to choose the best distance metric for this particular set of data?
Is it possible to compare distances among species instead of comparing regions? What would be the meaning? Repeat this exercise for the species distances.
