Triple-negative breast cancer

- Tumour cells negative for ER,PR and HER2
- 10 to 15% of sporadic breast cancer cases
- Characteristics include:
    - higher prevalence among premenopausal African-American patients
    - high nuclear grade and proliferative indices
    - frequently abnormalities on p53 and BRCA 1 genes
    - chemosensitive but poor prognosis
    - peak risk of recurrence is between first and third years and the majority of deaths occur in the first 5 years following therapy.

The genomic and transcriptomic architecture of 2,000 breast tumours reveals novel subgroups

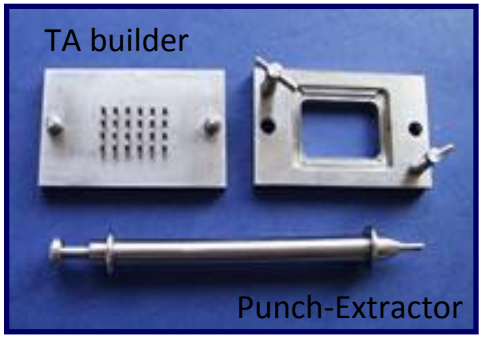
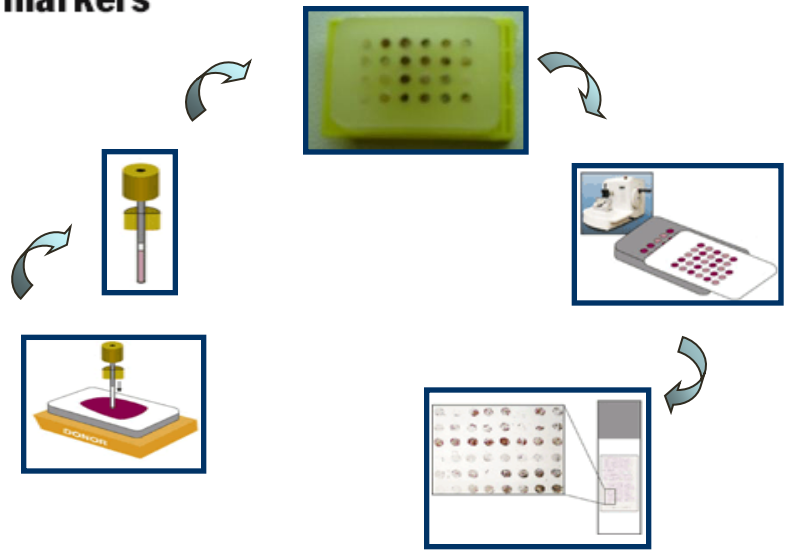
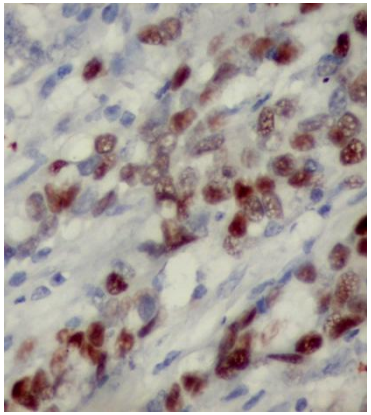
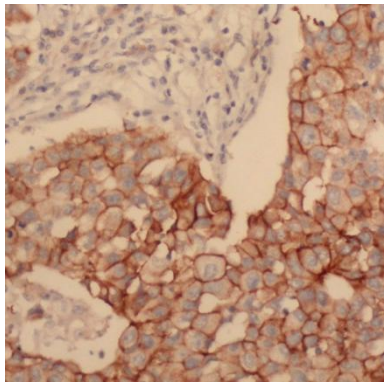
p63, cytokeratin 5, and P-cadherin: three molecular markers to distinguish basal phenotype in breast carcinomas



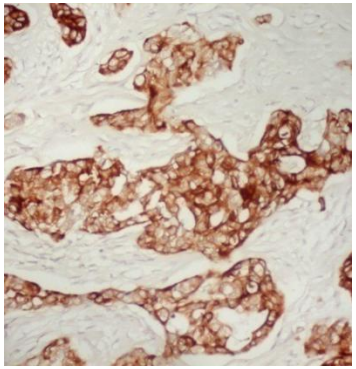




p63



P-Cad



CK 5

Triple-negative breast cancer is a heterogeneous clinical entity

- Gene expression profile classification revealed an heterogeneous group of breast malignancies:
  - Basal-like (EGFR and/or CK5/6 and /or CK14 and/or PCad)
  - Claudin-low (low/absent expression of adhesion molecules)
  - Molecular apocrine
  - Other intrinsic molecular subtypes
  - Normal-breast like (normal adipose tissue and other non epithelial and basal epithelial) ???

Claudin-low carcinomas

New molecular subgroup, sorted from the triple negative breast cancer group

Prat *et al. Breast Cancer Research* 2010, **12**:R68

- Low expression of genes involved in tight junctions and cell-cell adhesion:
  - *Claudins 3, 4, 7,*
  - *Occludin*
  - *Ecadherin*

- Low expression of luminal genes,
- Inconsistent basal gene expression
- High expression of lymphocyte and endothelial cell markers

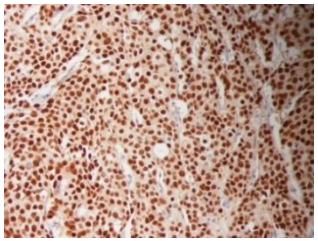
Breast Cancer RESEARCH

SECTION INTRODUCTION

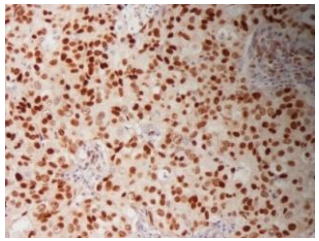
Molecular profiling currently offers no more than tumour morphology and basic immunohistochemistry

➢ Despite the huge amount of resources allocated to translational research, only three predictive markers are used to define the therapy of breast cancer patients:

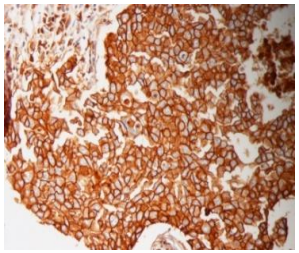
ER



PR



HER2



research article

Annals of Oncology 23 (Supplement 6): vi13–vi18, 2012
doi:10.1093/annonc/mds188

Understanding the biology of triple-negative breast cancer

C. Criscitiello[1*,†], H. A. Azim, Jr[1,†], P. C. Schouten[2], S. C. Linn[2,‡] & C. Sotiriou[1,‡]

Histology	Molecular hallmarks	Proportion TNBC (%)	Prognosis
IDC-NOS	HER1+and/or CK5/6+	12–17	Reference group: 5-year DFS: 60%–65% 10-year DFS: 55%–60%
Metaplastic carcinoma	Squamous epithelium differentiation; mesenchymal elements; EGFR+, CK5/6+, CK14+, p63+	90	Adverse in comparison with IDC-NOS
Medullary carcinoma	Lymphoplasmacytic infiltrate; *P53* mutation; *BRCA1* mutation	95	Favourable in comparison with IDC-NOS
Adenoid cystic carcinoma	Low grade; resembles tumours found in salivary glands; c-KIT+; fusion gene *MYB-NFIB*+; MYB overexpression	90–100	Favourable in comparison with IDC-NOS; 10-year OS: >90%
Apocrine carcinoma	Androgen receptor overexpression	40–60	Favourable in comparison with IDC-NOS

PUTATIVE TARGETS

ANGIO
MAK- KINASE
PCAD

EGFR

BRCA1

AR

Where are we today (at least at our Institution)?

- ER, PR and HER2 status are the major drivers of clinical decision making regarding the type of systemic therapy.
- These 3 biomarkers in conjunction with histologic grade/mitotic count could be used to infer luminal, HER2 and TN subtypes .
- But given current options for systemic therapy, need to sub-classify beyond ER,PR and HER2 in clinical practice is debatable.
- Clinicians are increasingly thinking about breast cancers by their molecular subtype.

ACKNOWLEDGEMENTS
