

#### T14 - Indexing local features Computer Vision, FCUP, 2012 Miguel Coimbra Slides by Prof. Kristen Grauman

#### Index

"Along I-75," From Detroit to Florida: inside back cover "Drive I-95," From Boston to Florida: inside back cover 1929 Spanish Trail Roadway; 101-102,104 511 Traffic Information; 83 A1A (Barrier Isi) - I-95 Access: 86 AAA (and CAA); 83 AAA National Office: 88 Abbreviations. Colored 25 mile Maps; cover Exit Services; 196 Travelogue; 85 Africa: 177 Agricultural Inspection Stns: 126 Ah-Tah-Thi-Ki Museum; 160 Air Conditioning, First; 112

Butterfly Center, McGuire; 134 CAA (see AAA) CCC, The; 111,113,115,135,142 Ca d'Zan: 147 Caloosahatchee River; 152 Name; 150 Canaveral Natni Seashore; 173 Cannon Creek Airpark: 130 Canopy Road; 106,169 Cape Canaveral; 174 Castillo San Marcos; 169 Cave Diving; 131 Cavo Costa, Name: 150 Celebration; 93 Charlotte County; 149 Charlotte Harbor; 150 Chautauqua; 116 Chipley: 114

#### Matching local features

#### Matching local features

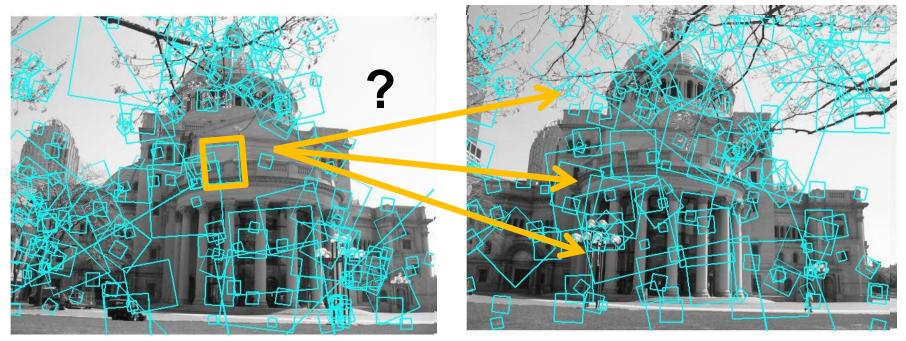

Image 1

Image 2

To generate **candidate matches**, find patches that have the most similar appearance (e.g., lowest SSD) Simplest approach: compare them all, take the closest (or closest k, or within a thresholded distance)

### Matching local features

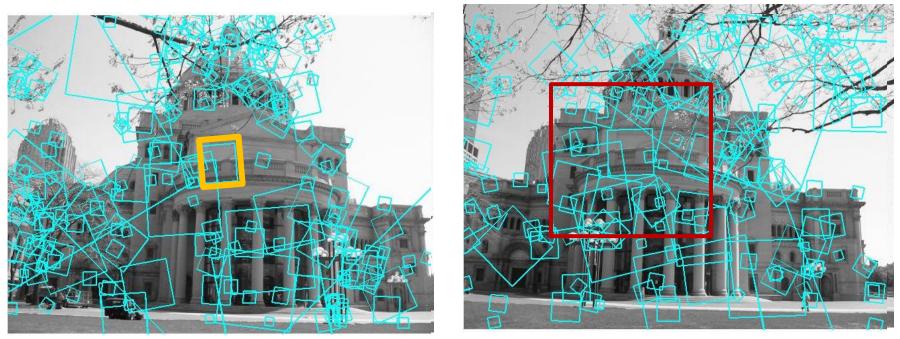

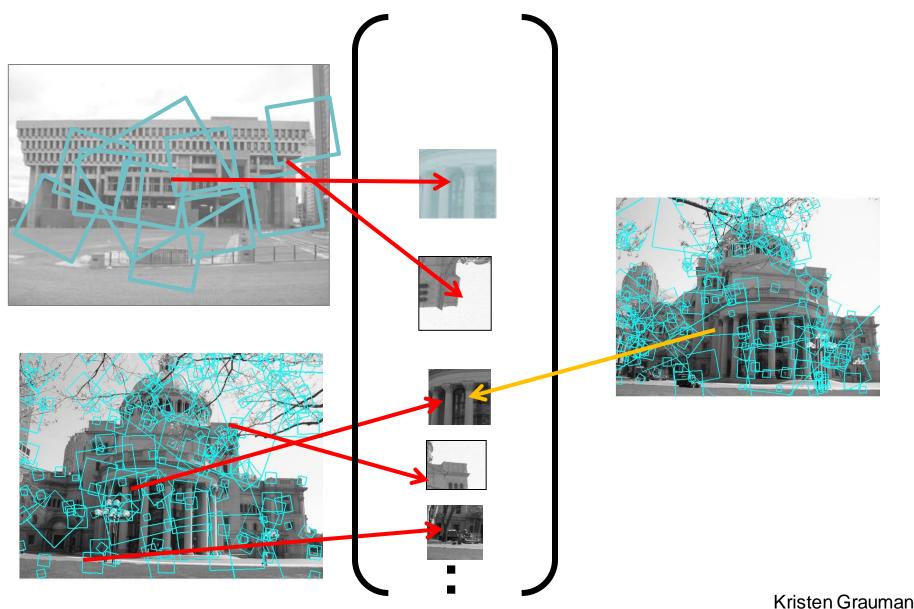

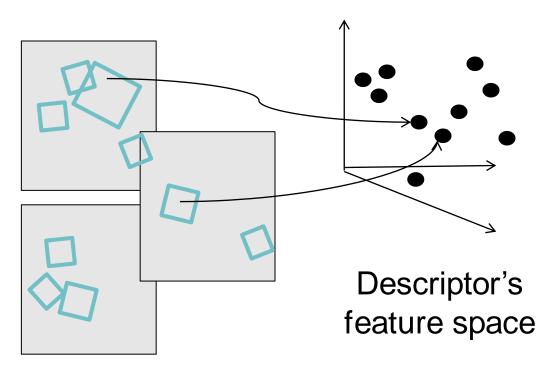

Image 1

Image 2

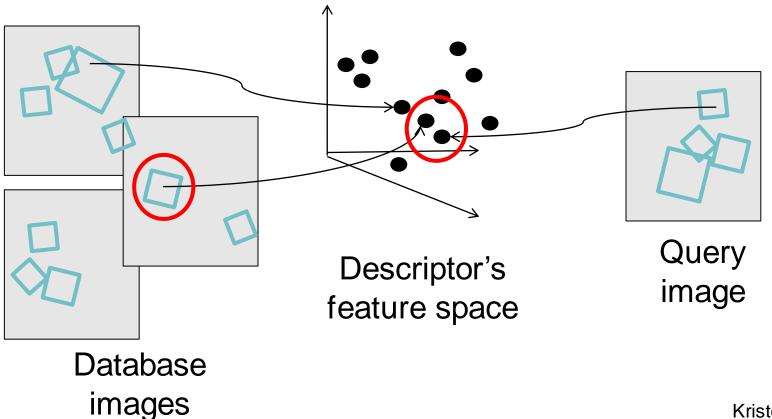

In stereo case, may constrain by proximity if we make assumptions on max disparities.

 Each patch / region has a descriptor, which is a point in some high-dimensional feature space (e.g., SIFT)

• When we see close points in feature space, we have similar descriptors, which indicates similar local content.

 With potentially thousands of features per image, and hundreds to millions of images to search, how to efficiently find those that are relevant to a new image?

#### Indexing local features: inverted file index

•

#### Index

For text documents, an efficient way to find all *pages* on which a *word* occurs is to use an index...

- We want to find all images in which a feature occurs.
- To use this idea, we'll need to map our features to "visual words".

#### Text retrieval vs. image search

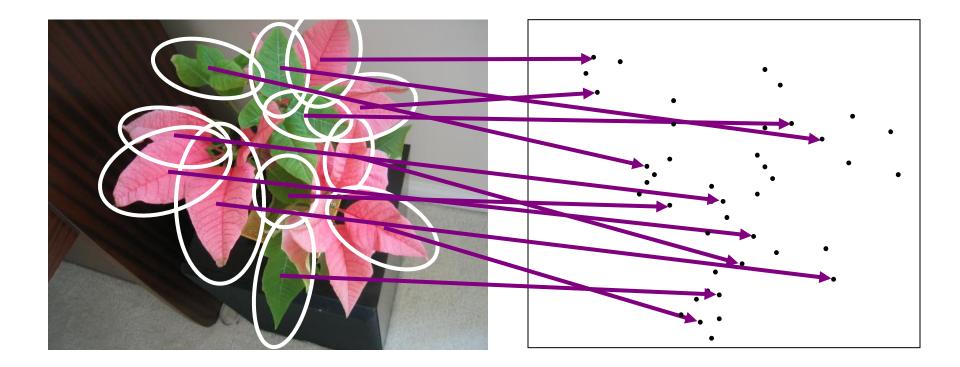

• What makes the problems similar, different?

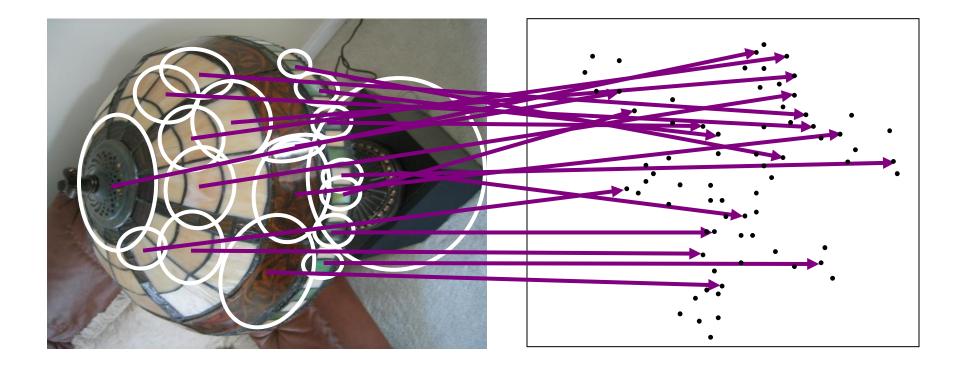

• Extract some local features from a number of images ...

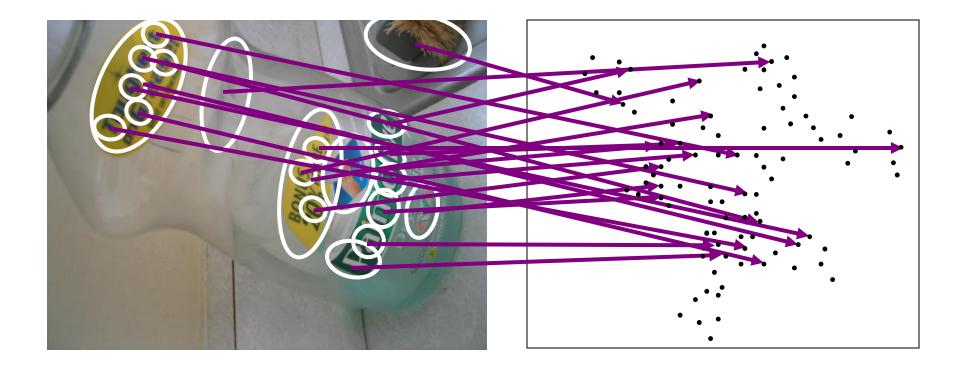

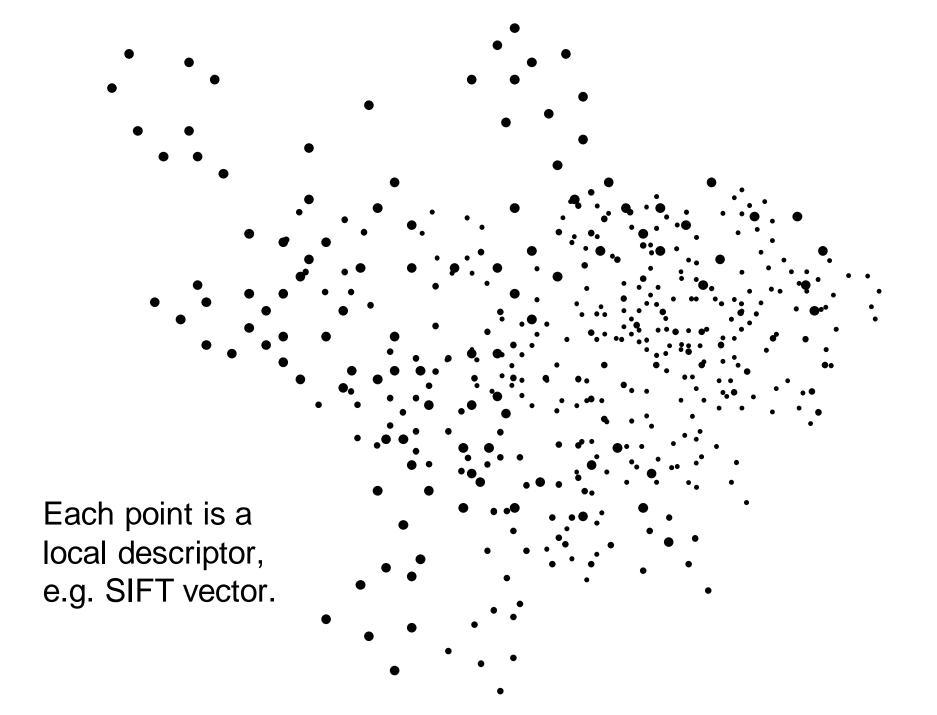

e.g., SIFT descriptor space: each point is 128-dimensional

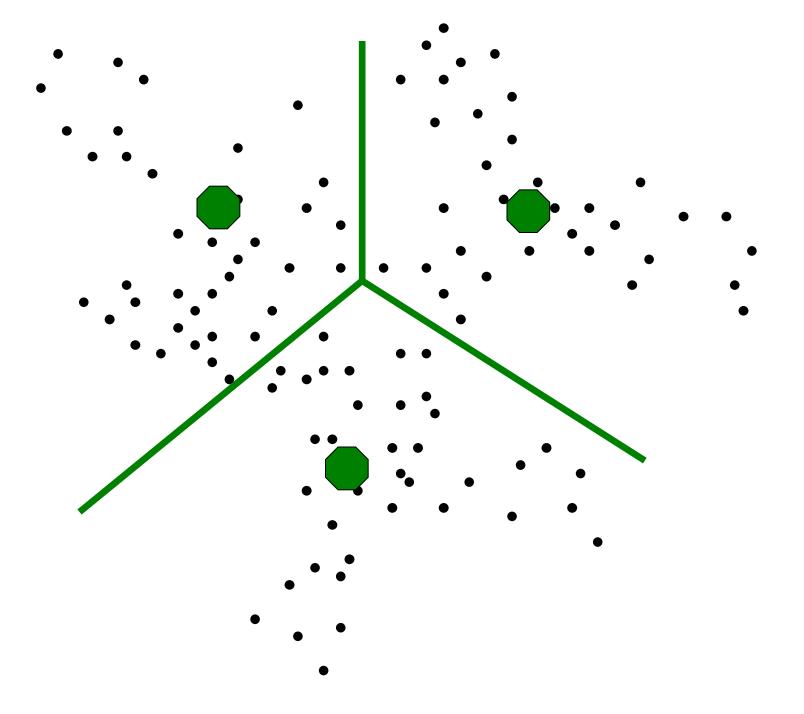

Slide credit: D. Nister, CVPR 2006

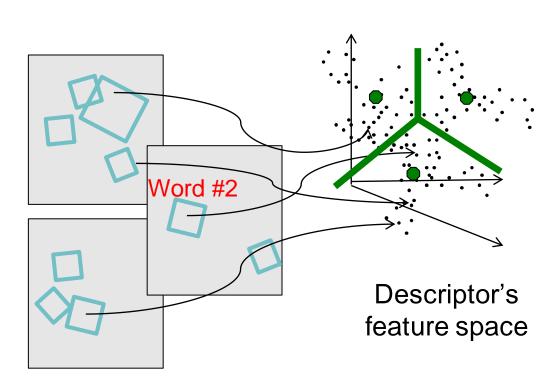

### Visual words

 Map high-dimensional descriptors to tokens/words by quantizing the feature space

- Quantize via clustering, let cluster centers be the prototype "words"
- Determine which word to assign to each new image region by finding the closest cluster center.

#### Visual words

 Example: each group of patches belongs to the same visual word

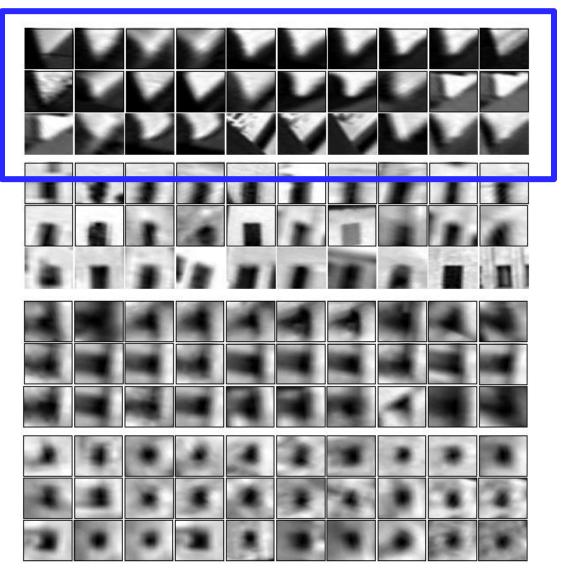

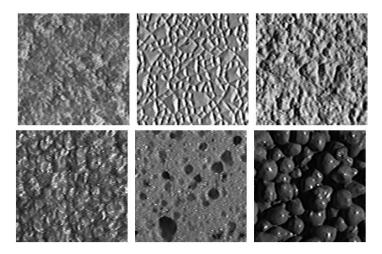

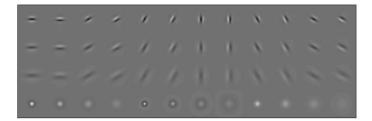

Figure from Sivic & Zisserman, ICCV 2003 Kristen Grauman

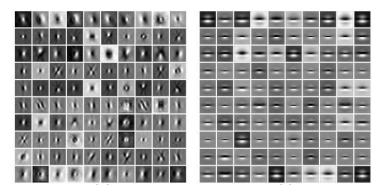

#### Visual words and textons

- First explored for texture and material representations
- Texton = cluster center of filter responses over collection of images
- Describe textures and materials based on distribution of prototypical texture elements.

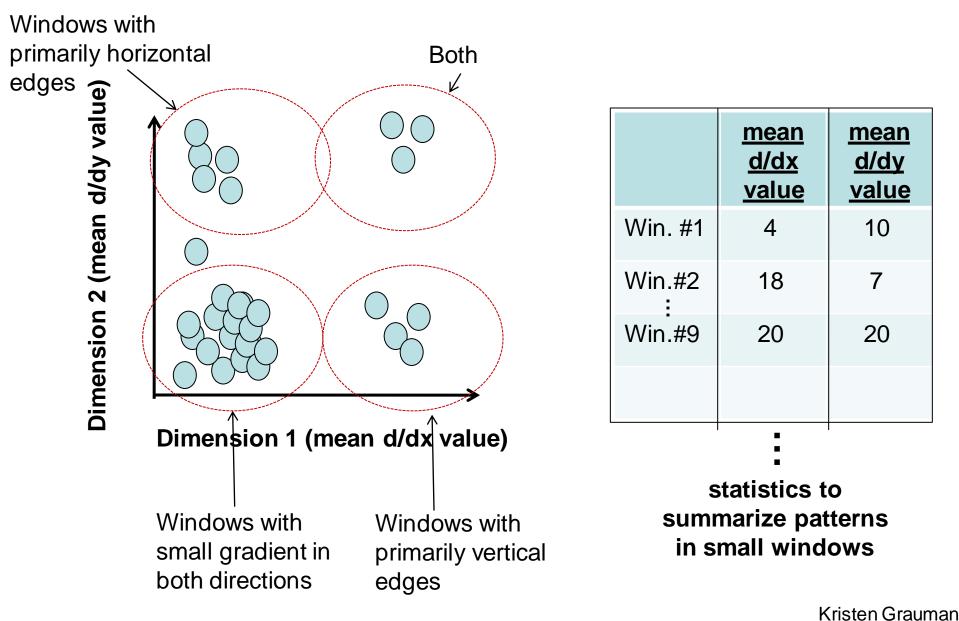

Leung & Malik 1999; Varma & Zisserman, 2002

#### Recall: Texture representation example

### Visual vocabulary formation

Issues:

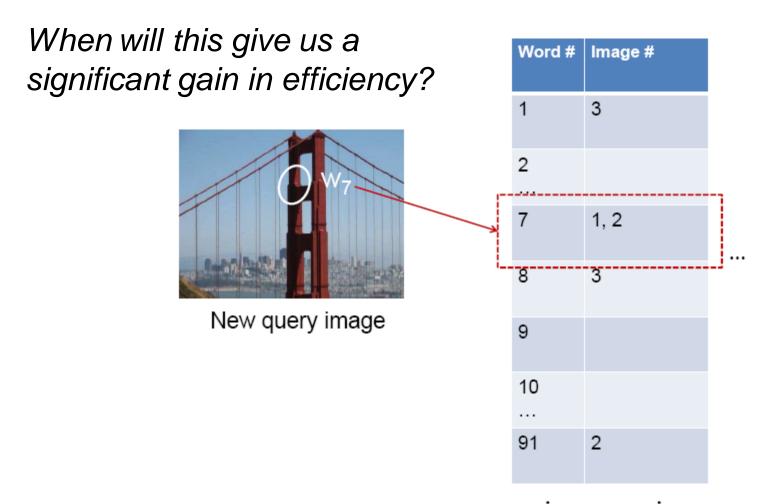

- Sampling strategy: where to extract features?
- Clustering / quantization algorithm
- Unsupervised vs. supervised
- What corpus provides features (universal vocabulary?)
- Vocabulary size, number of words

#### Inverted file index

Database images are loaded into the index mapping words to image numbers

#### Inverted file index

 New query image is mapped to indices of database images that share a word.

 If a local image region is a visual word, how can we summarize an image (the document)?

#### Analogy to documents

Of all the sensory impressions proceeding to the brain, the visual experiences are the dominant ones. Our perception of the world around us is based essentially on the messages that our eyes. etinal For a long tig sensory, brain, image way sual centers visual, perception, movie s etinal, cerebral cortex. image. discov eye, cell, optical know th nerve, image percepti more com Hubel, Wiesel following the to the various C. ortex. Hubel and Wiesel na demonstrate that the message abo image falling on the retina undergoe wise analysis in a system of nerve cell stored in columns. In this system each has its specific function and is responsible a specific detail in the pattern of the retinal image.

China is forecasting a trade surplus of \$90bn (£51bn) to \$100bn this year, a threefold increase on 2004's \$32bn. The Commerce Ministry said the surplus would be created by a predicted 30% \$750bn. compared w China, trade, \$660bn. 🕽 annov t surplus, commerce China's exports, imports, US, delibe yuan, bank, domestic, agrees yuan is foreign, increase, governo trade, value also need demand so country. China yuan against the done nd permitted it to trade within a narrow but the US wants the yuan to be allowed freely. However, Beijing has made it cit it will take its time and tread carefully be allowing the yuan to rise further in value.

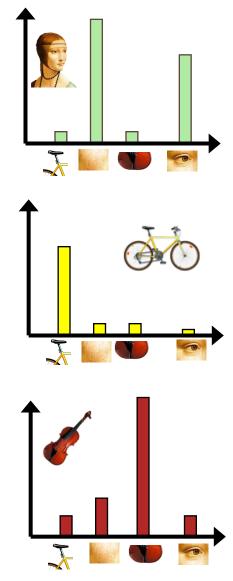

## Bags of visual words

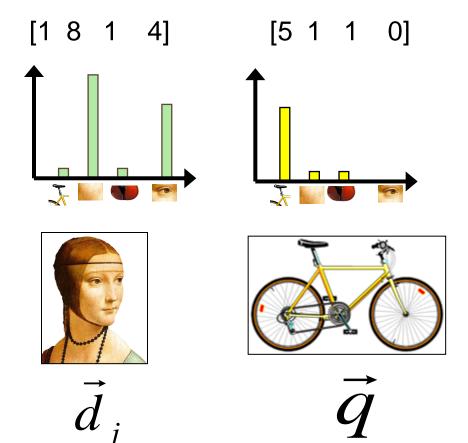

- Summarize entire image based on its distribution (histogram) of word occurrences.
- Analogous to bag of words representation commonly used for documents.

# Comparing bags of words

 Rank frames by normalized scalar product between their (possibly weighted) occurrence counts---*nearest neighbor* search for similar images.

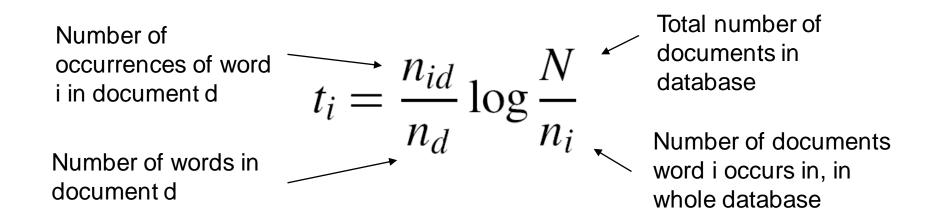

$$sim(d_j, q) = \frac{\langle d_j, q \rangle}{\|d_j\| \|q\|}$$
$$= \frac{\sum_{i=1}^V d_j(i) * q(i)}{\sqrt{\sum_{i=1}^V d_j(i)^2}} * \sqrt{\sum_{i=1}^V q(i)^2}$$

for vocabulary of V words

# tf-idf weighting

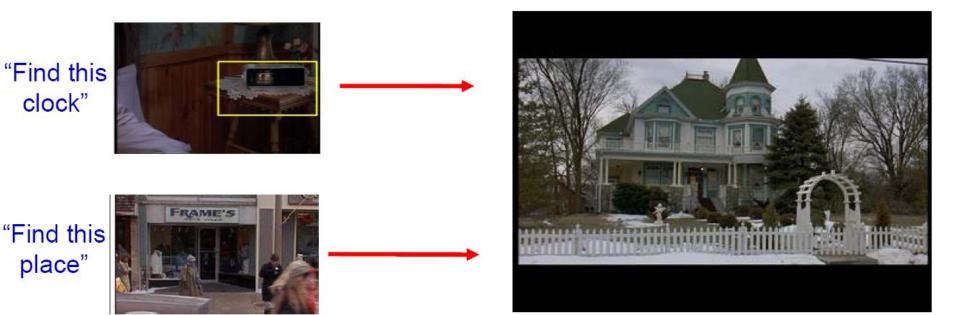

- Term frequency inverse document frequency
- Describe frame by frequency of each word within it, downweight words that appear often in the database
- (Standard weighting for text retrieval)

# Bags of words for content-based image retrieval

#### Visually defined query

#### "Groundhog Day" [Rammis, 1993]

What is the computational advantage of the hierarchical representation bag of words, vs. a flat vocabulary?

### Bags of words: pros and cons

- + flexible to geometry / deformations / viewpoint
- + compact summary of image content
- + provides vector representation for sets
- + very good results in practice
- basic model ignores geometry must verify afterwards, or encode via features
- background and foreground mixed when bag covers whole image
- optimal vocabulary formation remains unclear

### Summary

- Matching local invariant features: useful not only to provide matches for multi-view geometry, but also to find objects and scenes.
- **Bag of words** representation: quantize feature space to make discrete set of visual words
  - Summarize image by distribution of words
  - Index individual words
- Inverted index: pre-compute index to enable faster search at query time
