# A Sequence Modeling Problem: Predict the Next Word

# A sequence modeling problem: predict the next word

“This morning I took my cat for a walk.”

Adapted from H. Suresh, 6.S191 2018

# A sequence modeling problem: predict the next word

“This morning I took my cat for a walk.”

given these words

Adapted from H. Suresh, 6.S191 2018

# A sequence modeling problem: predict the next word

“This morning I took my cat for a walk.”

given these words

predict the  
next word

Adapted from H. Suresh, 6.S191 2018

# Idea #1: use a fixed window

“This morning I took my cat for a walk.”

given these  
two words

predict the  
next word

Adapted from H. Suresh, 6.S191 2018

# Idea #1: use a fixed window

“This morning I took my cat **for a** walk.”

given these    predict the  
two words    next word

One-hot feature encoding: tells us what each word is

[ 1 0 0 0 0 0 1 0 0 0 ]

for

a

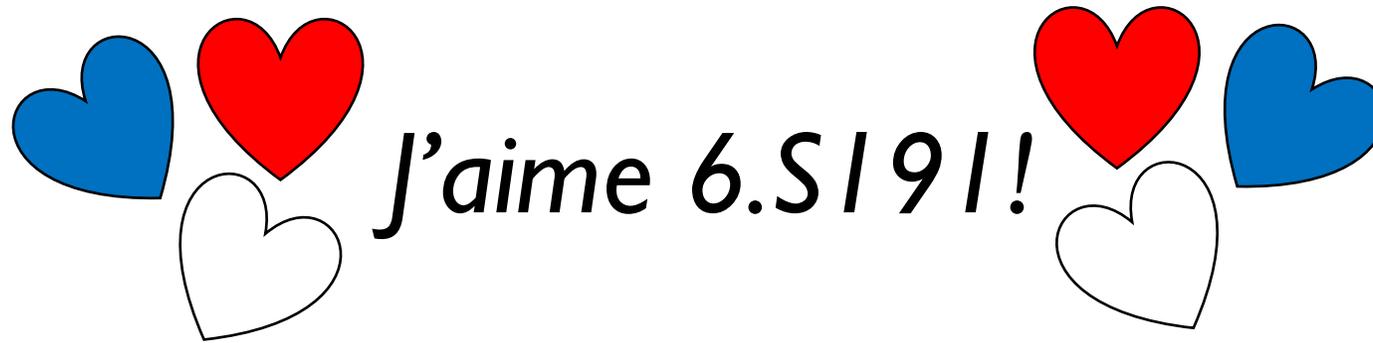

prediction

Adapted from H. Suresh, 6.S191 2018

# Problem #1: can't model long-term dependencies

“**France** is where I grew up, but I now live in Boston. I speak fluent \_\_\_\_.”

We need information from **the distant past** to accurately predict the correct word.

# Idea #2: use entire sequence as set of counts

“This morning I took my cat for a”

“bag of words”

[ 0 1 0 0 1 0 0 ... 0 0 1 1 0 0 0 1 ]

prediction

Adapted from H. Suresh, 6.S191 2018

# Problem #2: counts don't preserve order

The food was good, not bad at all.

vs.

The food was bad, not good at all.

# Idea #3: use a really big fixed window

“This morning I took my cat for a walk.”

given these  
words

predict the  
next word

[ 1 0 0 0 0 0 0 0 0 1 0 0 1 0 0 0 1 0 0 0 0 0 0 1 0 ... ]

morning I took this cat

prediction

Adapted from H. Suresh, 6.S191 2018

# Problem #3: no parameter sharing

[ 1 0 0 0 0 0 0 0 0 1 0 0 1 0 0 0 1 0 0 0 0 0 0 1 0 ... ]  
this morning took the cat

Each of these inputs has a **separate parameter**:

# Problem #3: no parameter sharing

[ 1 0 0 0 0 0 0 0 0 1 0 0 1 0 0 0 1 0 0 0 0 0 0 1 0 ... ]  
this morning took the cat

Each of these inputs has a **separate** parameter:

[ 0 0 0 1 0 0 0 1 0 0 0 1 0 0 0 0 1 0 0 0 0 0 0 0 0 0 1 ... ]  
this morning

# Problem #3: no parameter sharing

[ 1 0 0 0 0 0 0 0 0 1 0 0 1 0 0 0 1 0 0 0 0 0 0 1 0 ... ]  
this morning took the cat

Each of these inputs has a **separate** parameter:

[ 0 0 0 1 0 0 0 1 0 0 0 1 0 0 0 0 1 0 0 0 0 0 0 0 0 1 ... ]  
this morning

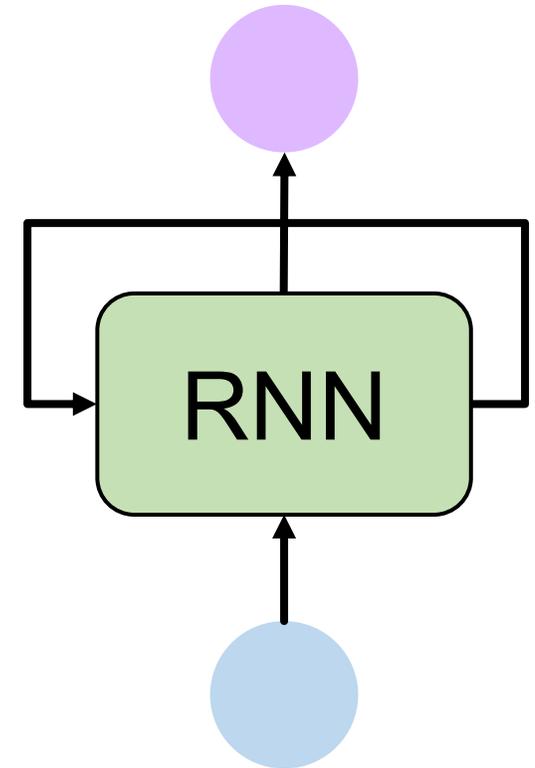

Things we learn about the sequence **won't transfer** if they appear **elsewhere** in the sequence.

Adapted from H. Suresh, 6.S191 2018

# Sequence modeling: design criteria

To model sequences, we need to:

1. Handle **variable-length** sequences
2. Track **long-term** dependencies
3. Maintain information about **order**
4. **Share parameters** across the sequence

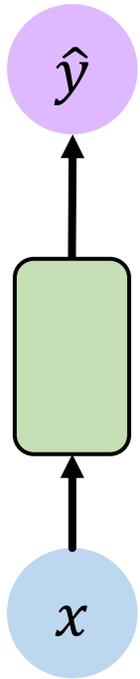

Today: **Recurrent Neural Networks (RNNs)** as an approach to sequence modeling problems

“I grew up in France, ... and I I speak fluent \_\_\_\_”

# Trick #1: activation functions

Using ReLU prevents  $f'$  from shrinking the gradients when  $x > 0$

Adapted from H. Suresh, 6.S191 2018

# Trick #2: parameter initialization

Initialize **weights** to identity matrix

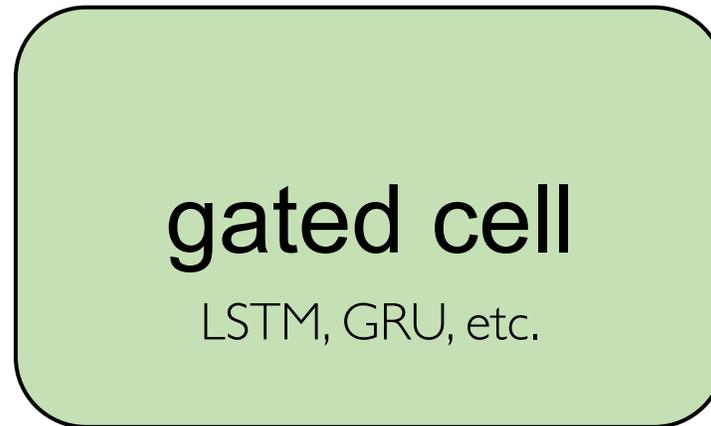

Initialize **biases** to zero

$$I_n = \begin{pmatrix} 1 & 0 & 0 & \dots & 0 \\ 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & 1 \end{pmatrix}$$

This helps prevent the weights from shrinking to zero.

# Solution #3: gated cells

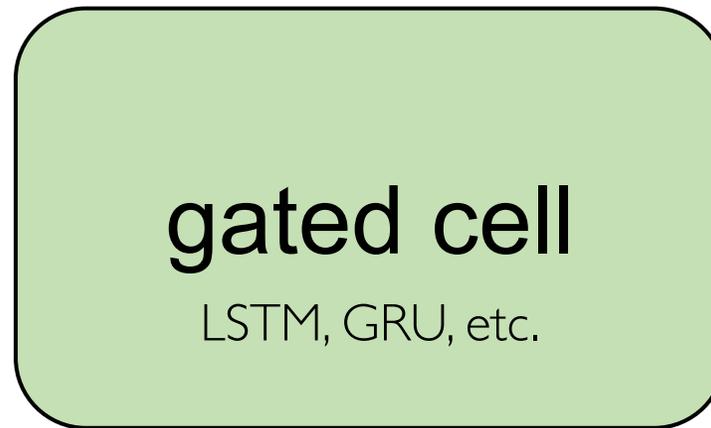

Idea: use a more **complex recurrent unit with gates** to control what information is passed through

Adapted from H. Suresh, 6.S191 2018

# Solution #3: gated cells

Idea: use a more **complex recurrent unit with gates** to control what information is passed through

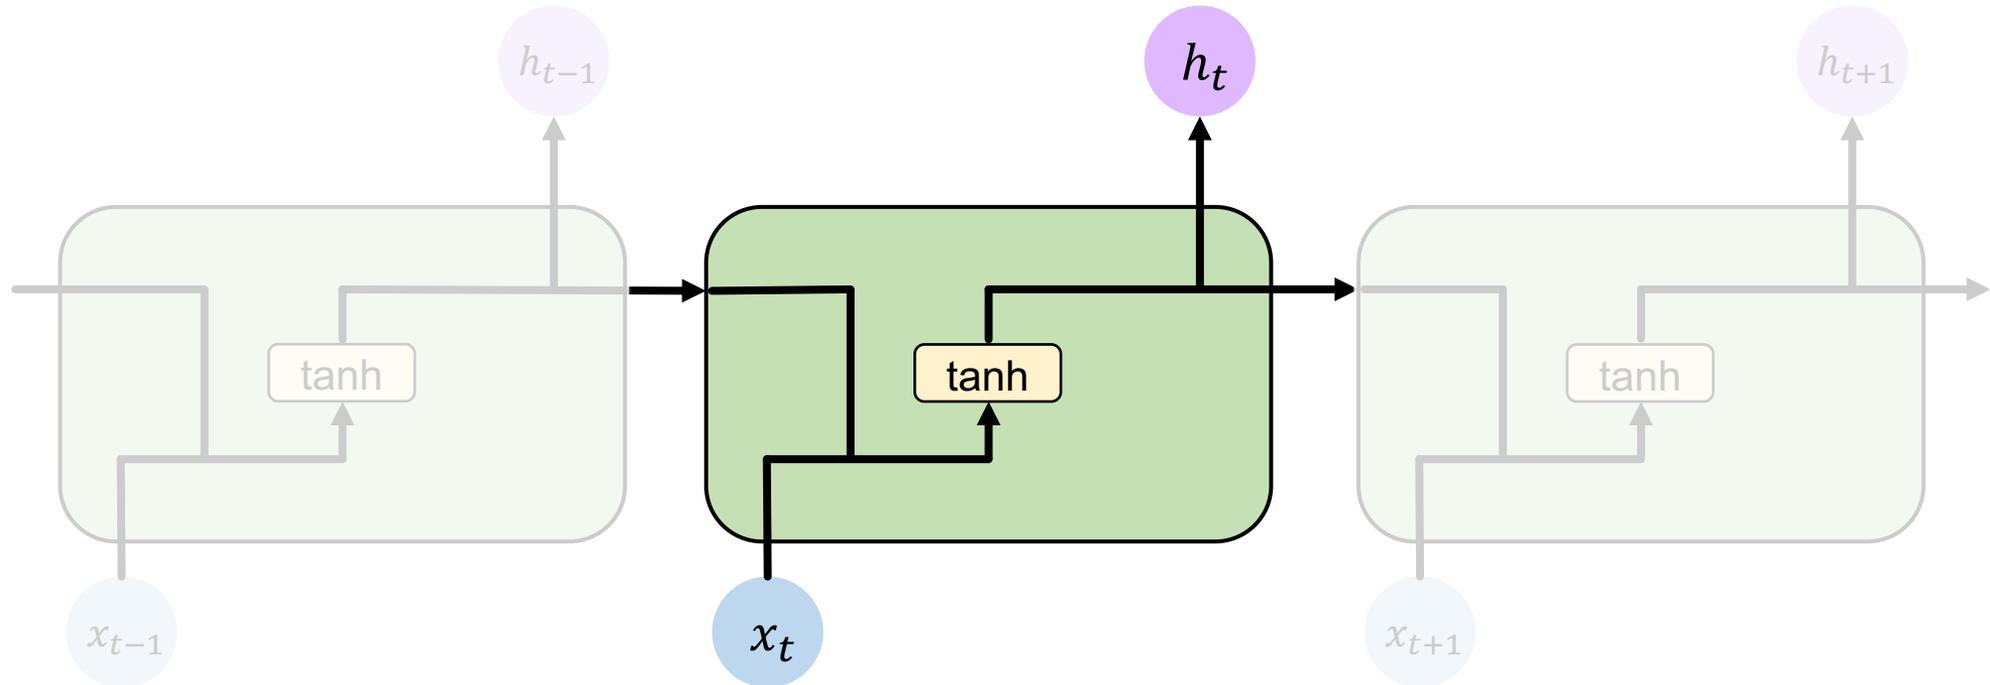

**Long Short Term Memory (LSTMs)** networks rely on a gated cell to track information throughout many time steps.

Adapted from H. Suresh, 6.S191 2018

# Long Short Term Memory (LSTM) Networks

# Standard RNN

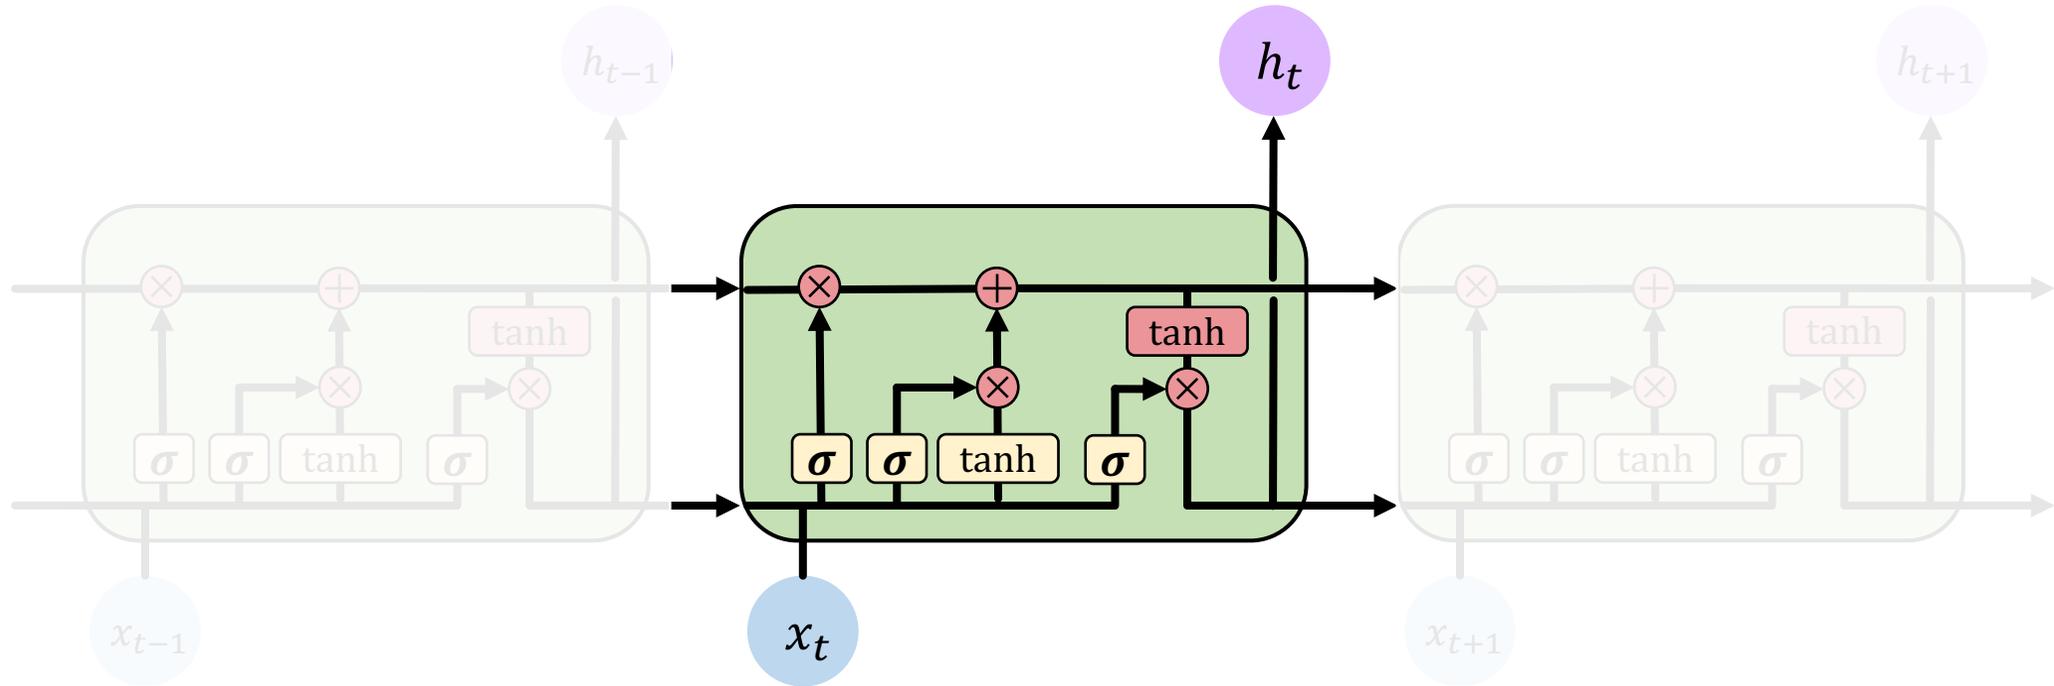

In a standard RNN, repeating modules contain a **simple computation node**

[2]

# Long Short Term Memory (LSTMs)

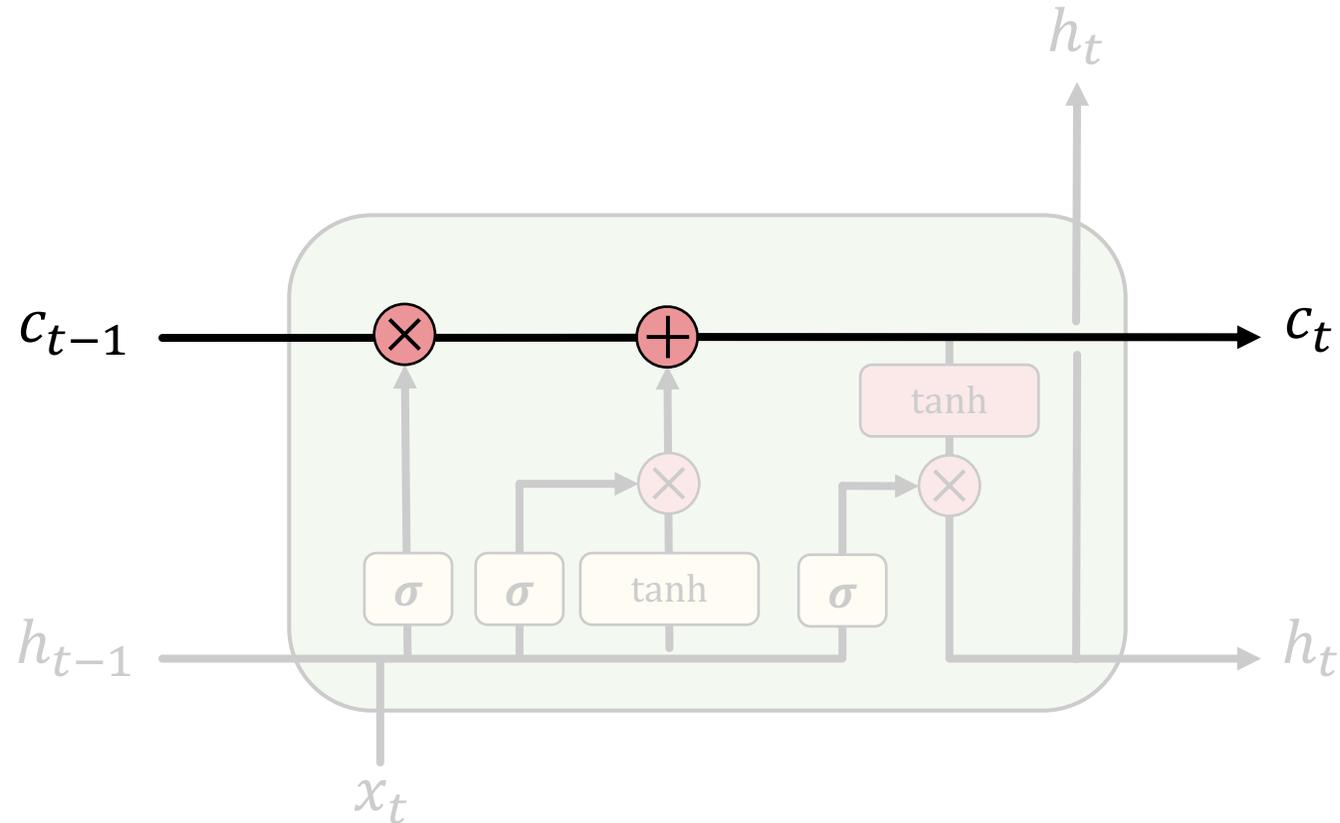

LSTM repeating modules contain **interacting layers** that **control information flow**

LSTM cells are able to track information throughout many timesteps

# Long Short Term Memory (LSTMs)

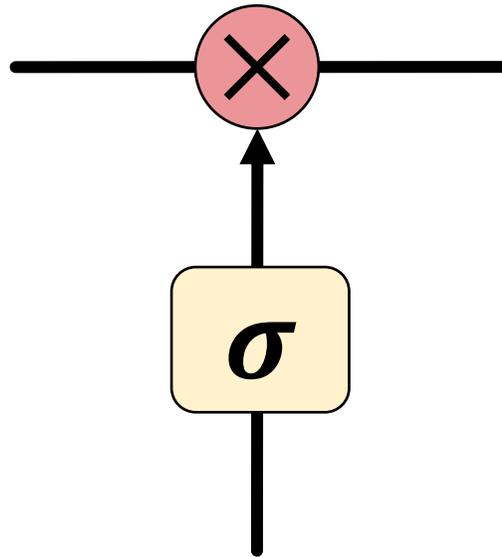

LSTMs maintain a **cell state**  $c_t$  where it's easy for information to flow

[2, 5]

# Long Short Term Memory (LSTMs)

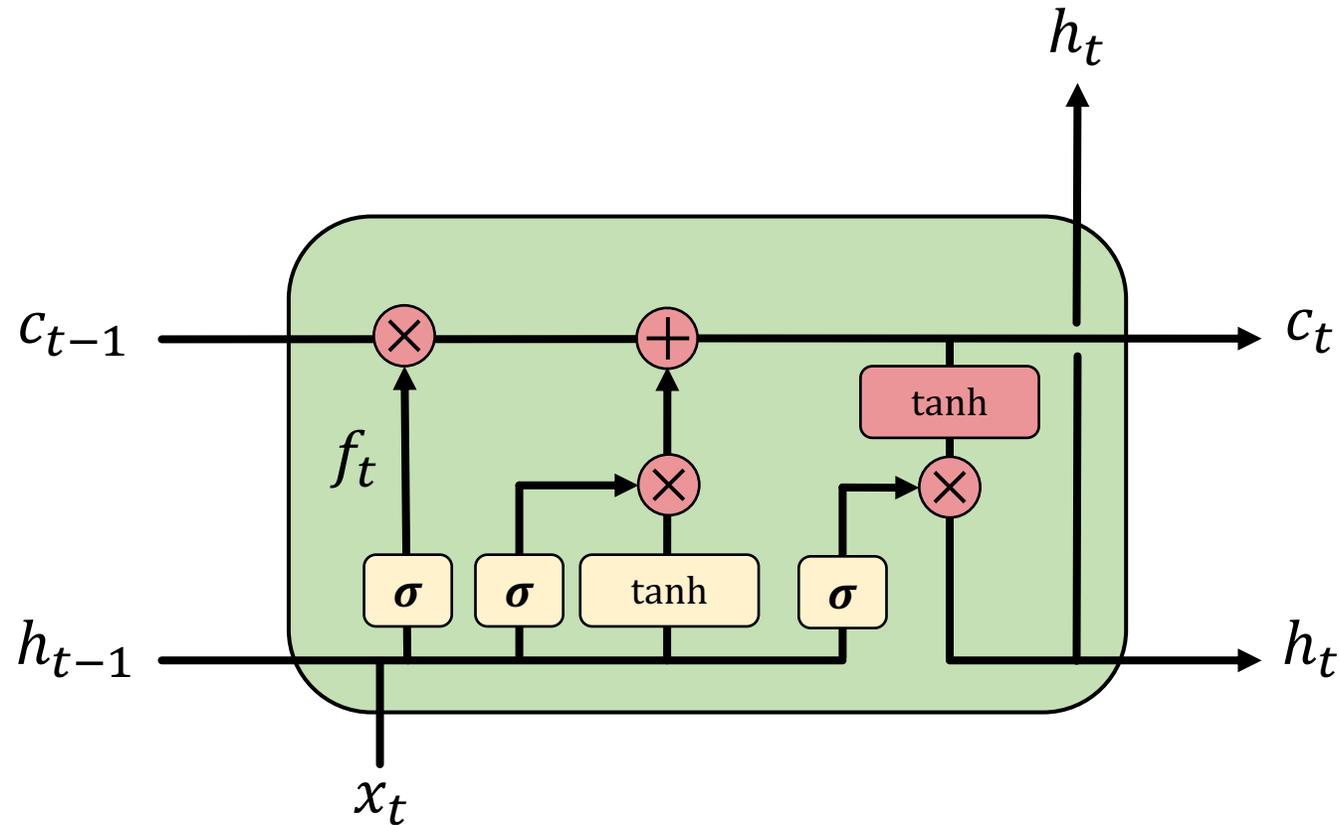

Information is **added** or **removed** to cell state through structures called **gates**

Gates optionally let information through, via a sigmoid neural net layer and pointwise multiplication

# Long Short Term Memory (LSTMs)

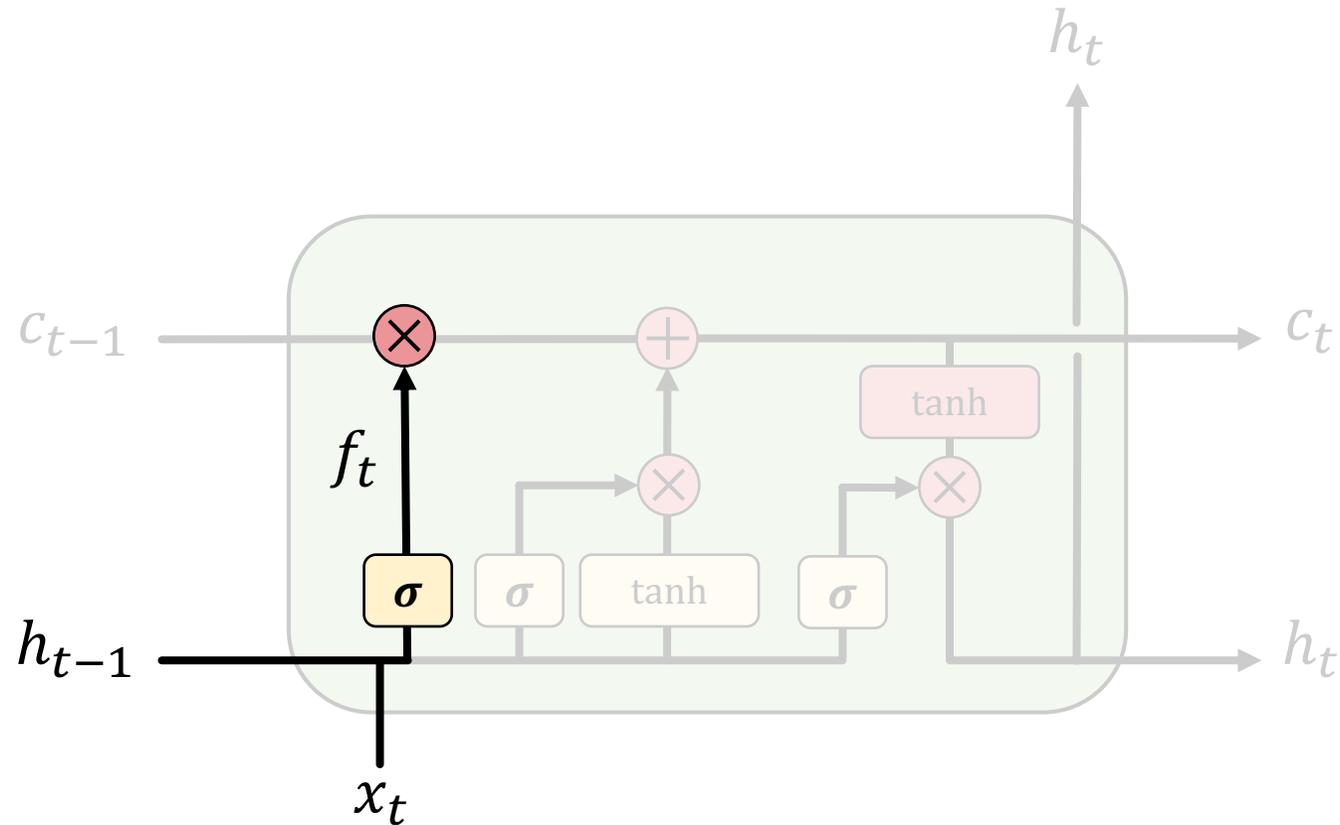

How do LSTMs work?

[2, 5]

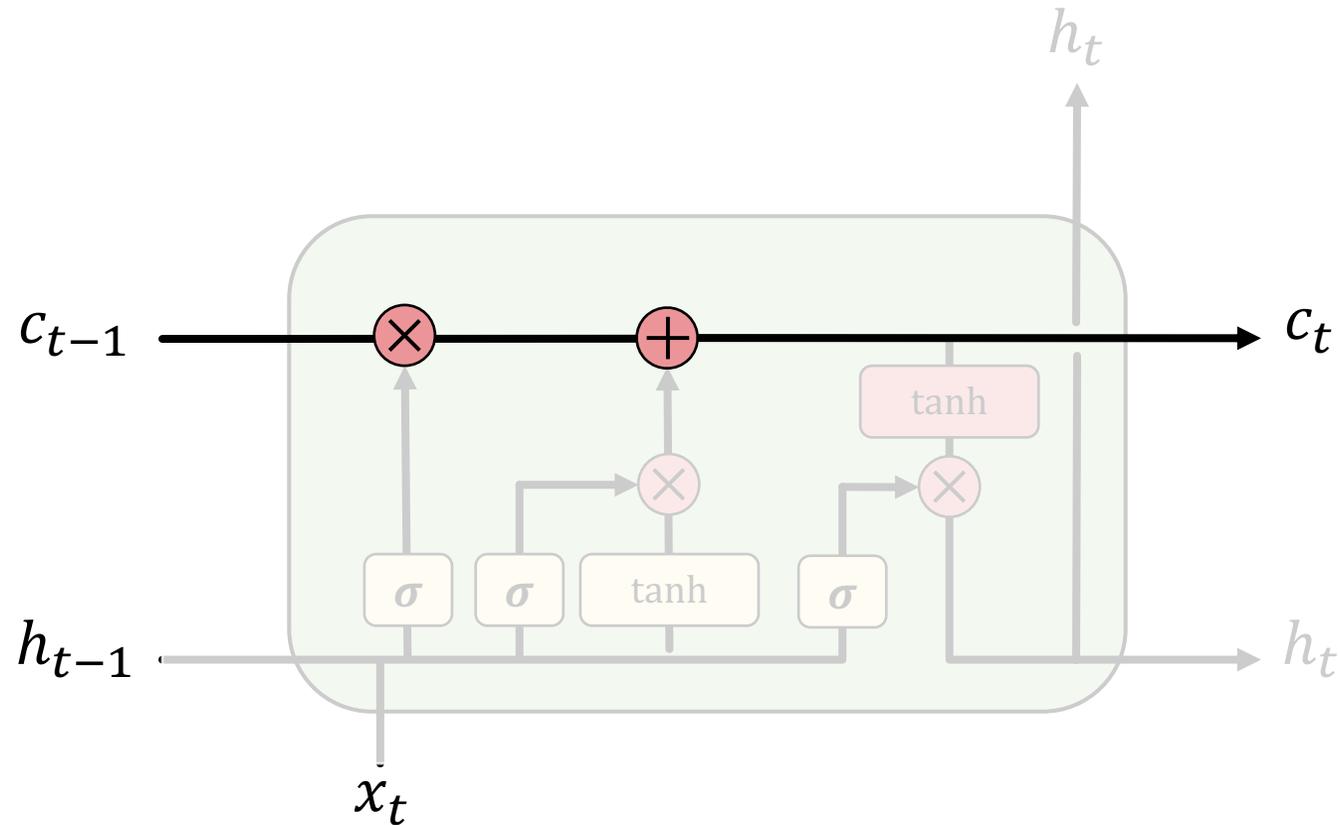

# Long Short Term Memory (LSTMs)

LSTMs **forget irrelevant** parts of the previous state

# Long Short Term Memory (LSTMs)

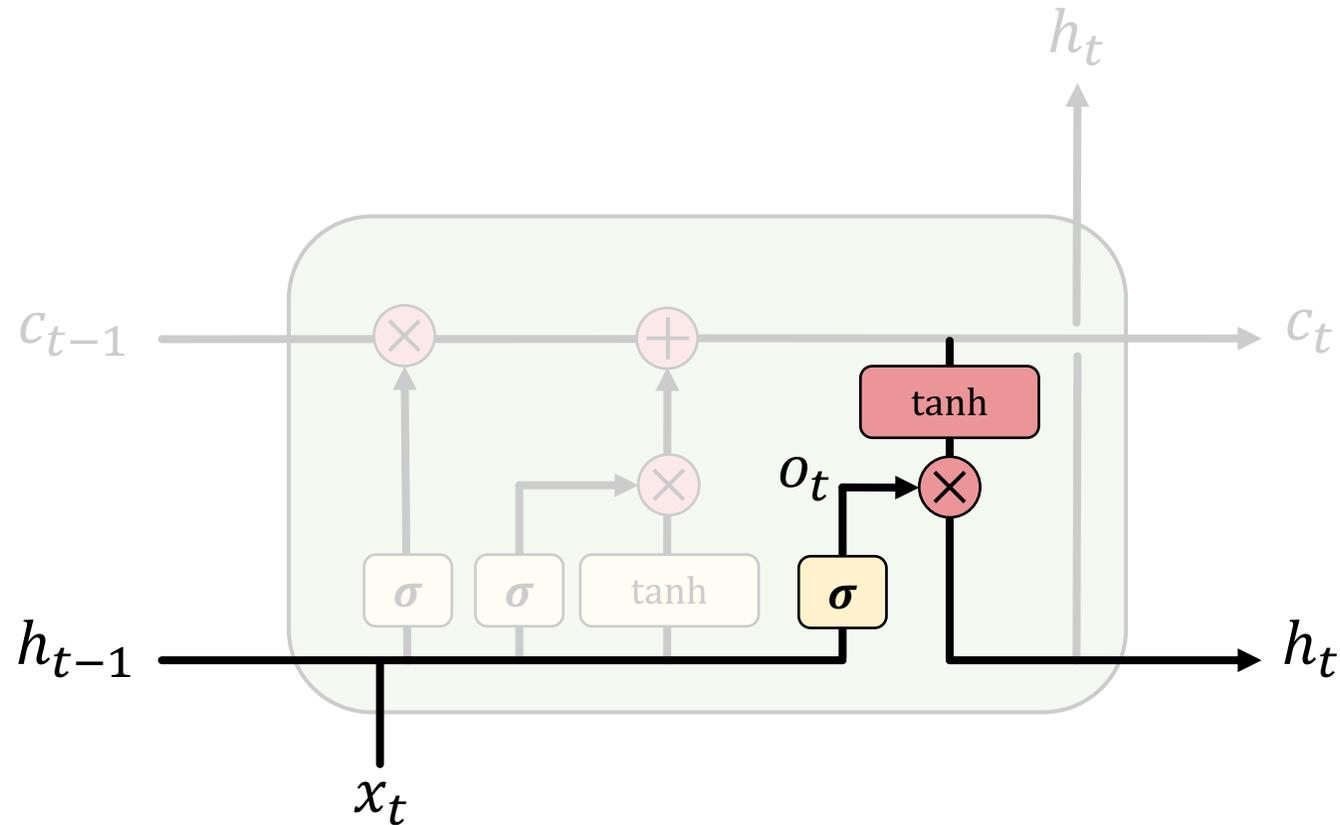

LSTMs **selectively update** cell state values

[2, 5]

# Long Short Term Memory (LSTMs)

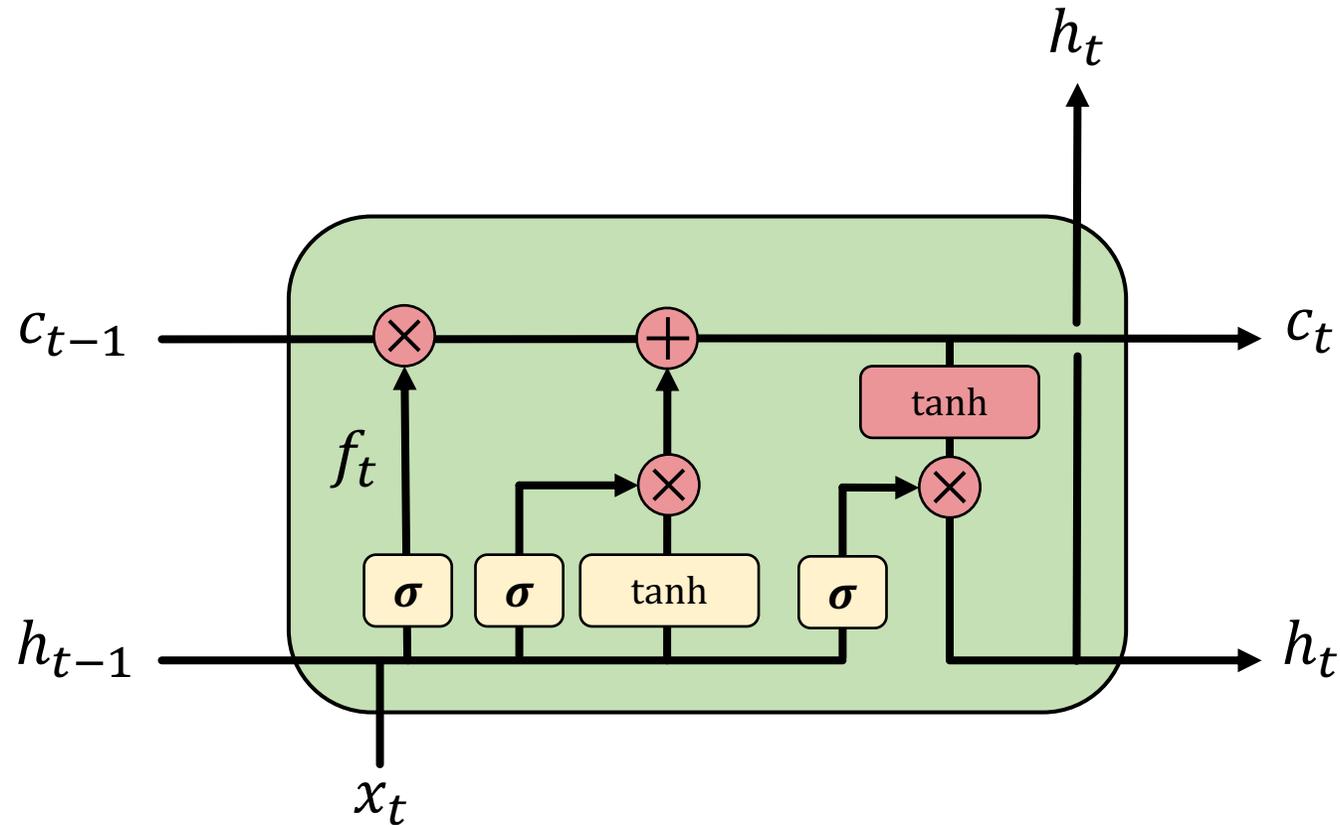

LSTMs use an **output gate** to output certain parts of the cell state

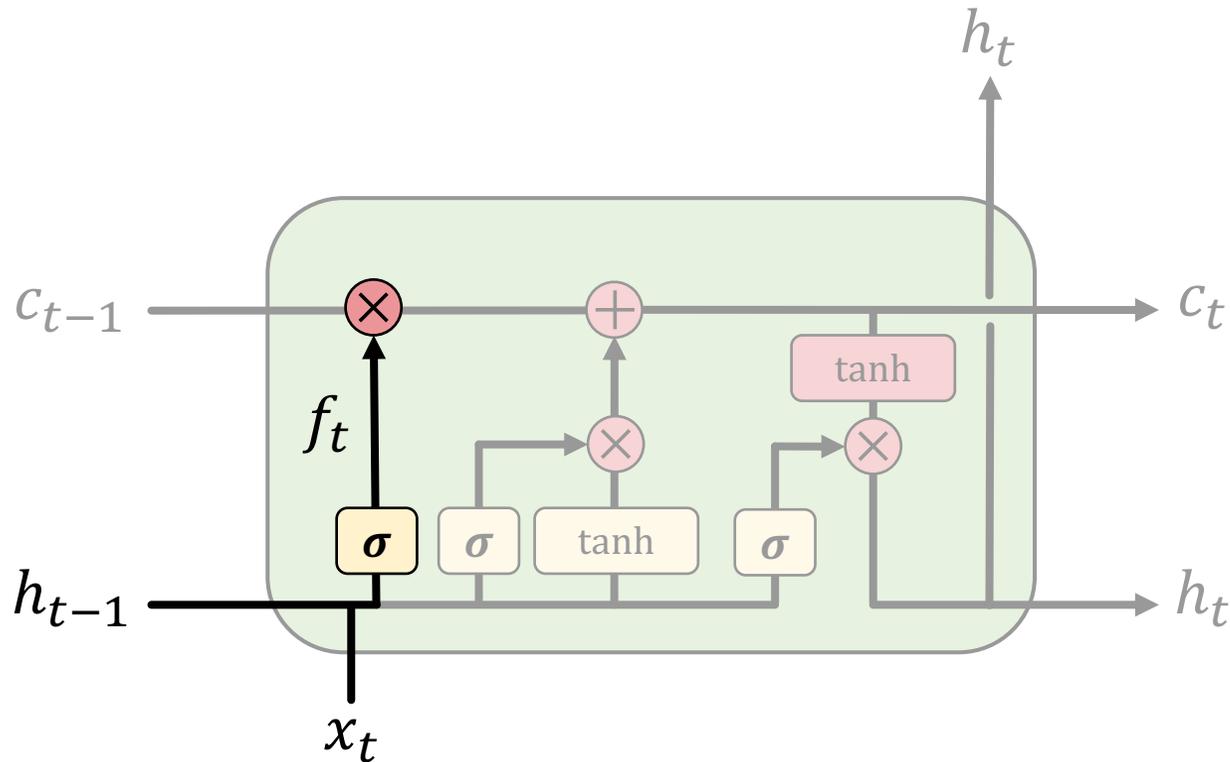

# Long Short Term Memory (LSTMs)

How do LSTMs work?

1) Forget 2) Update 3) Output

# LSTMs: forget irrelevant information

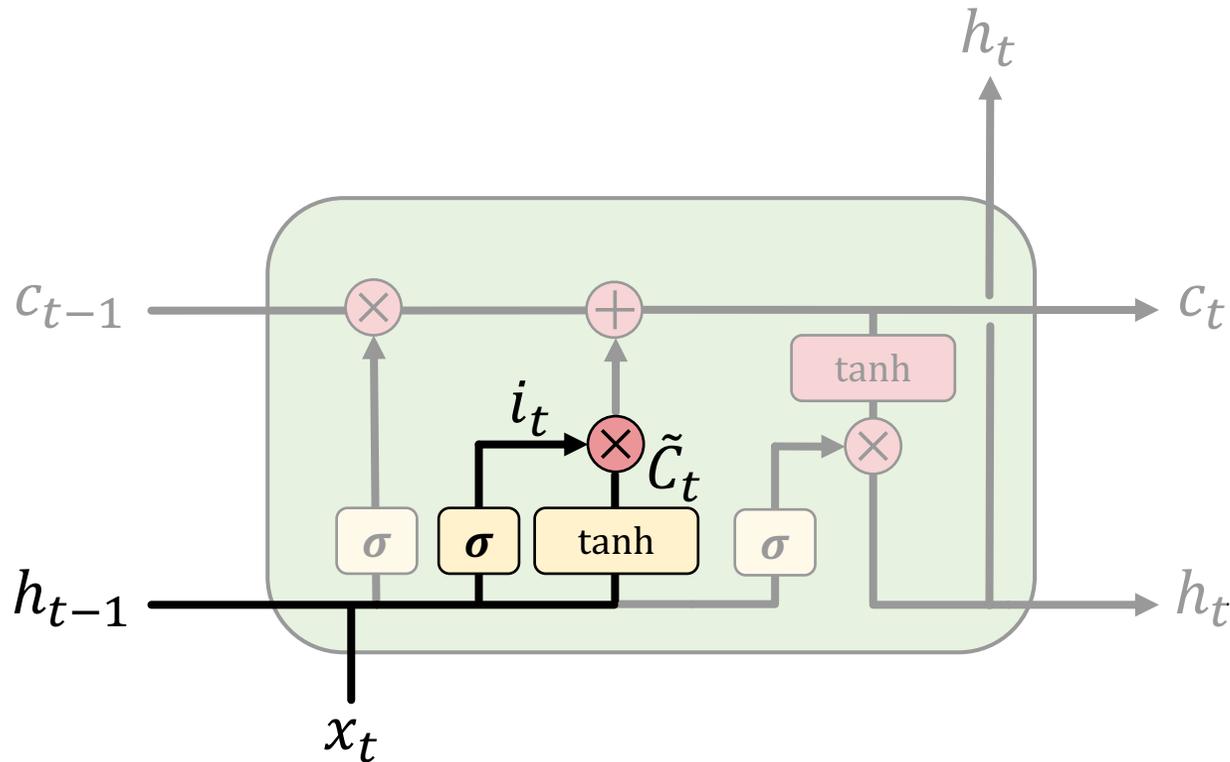

$$f_t = \sigma(\mathbf{W}_i[h_{t-1}, x_t] + b_f)$$

- Use previous cell output and input
- Sigmoid: value 0 and 1 – “completely forget” vs. “completely keep”

*ex: Forget the gender pronoun of previous subject in sentence.*

# LSTMs: identify new information to be stored

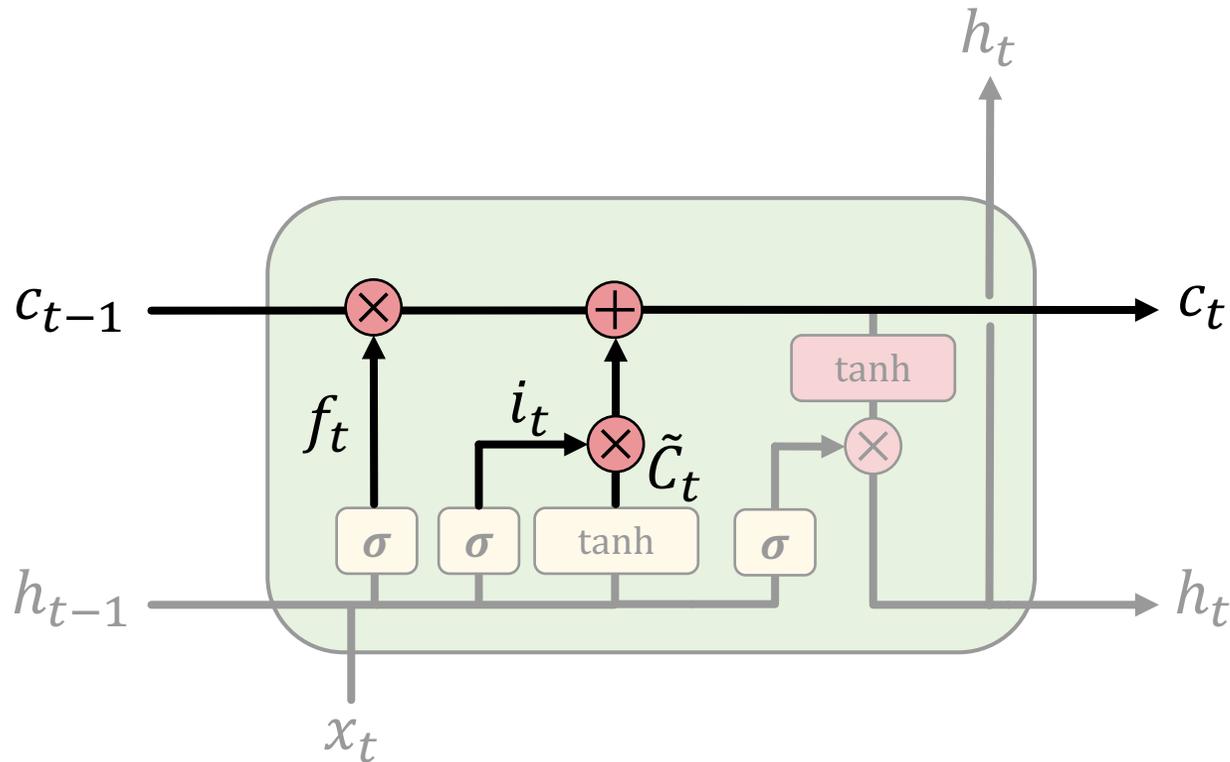

$$i_t = \sigma(\mathbf{W}_i [h_{t-1}, x_t] + b_i)$$
$$\tilde{C}_t = \tanh(\mathbf{W}_c [h_{t-1}, x_t] + b_c)$$

- Sigmoid layer: decide what values to update
- Tanh layer: generate new vector of “candidate values” that could be added to the state

*ex: Add gender of new subject to replace that of old subject.*

# LSTMs: update cell state

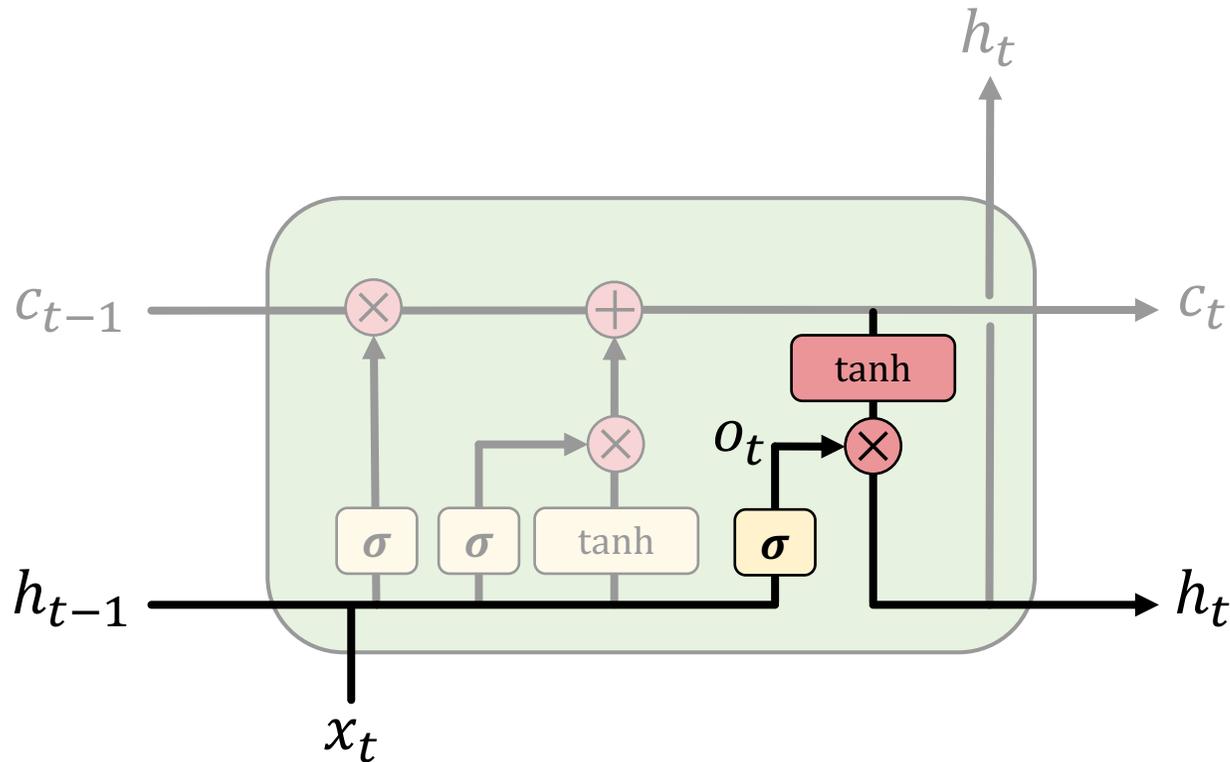

$$c_t = f_t * c_{t-1} + i_t * \tilde{C}_t$$

- Apply forget operation to previous internal cell state:  $f_t * c_{t-1}$
- Add new candidate values, scaled by how much we decided to update:  $i_t * \tilde{C}_t$

*ex: Actually drop old information and add new information about subject's gender.*

# LSTMs: output filtered version of cell state

$$o_t = \sigma(W_o [h_{t-1}, x_t] + b_o)$$

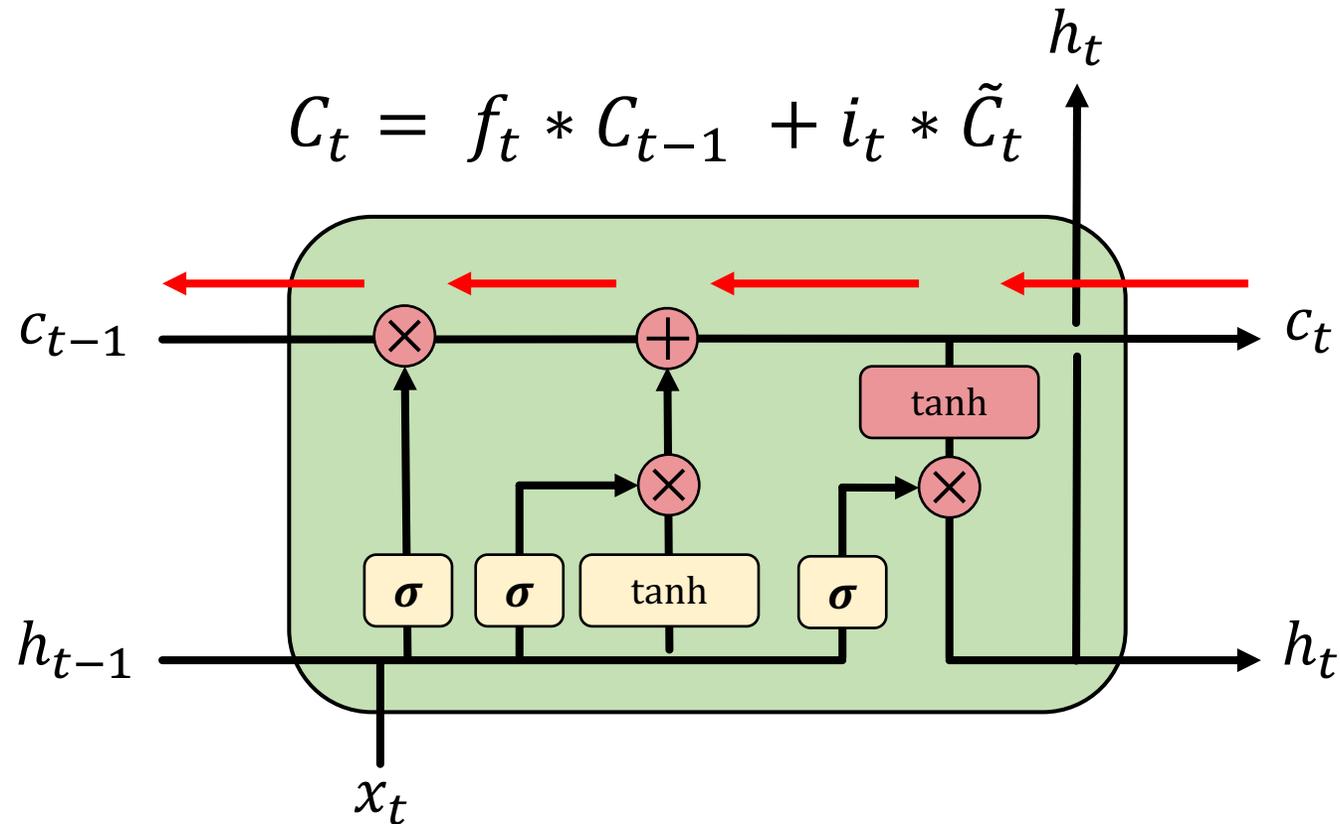

$$h_t = o_t * \tanh(C_t)$$

- Sigmoid layer: decide what parts of state to output
- Tanh layer: squash values between -1 and 1
- $o_t * \tanh(C_t)$ : output filtered version of cell state

*ex: Having seen a subject, may output information relating to a verb.*

# LSTM gradient flow

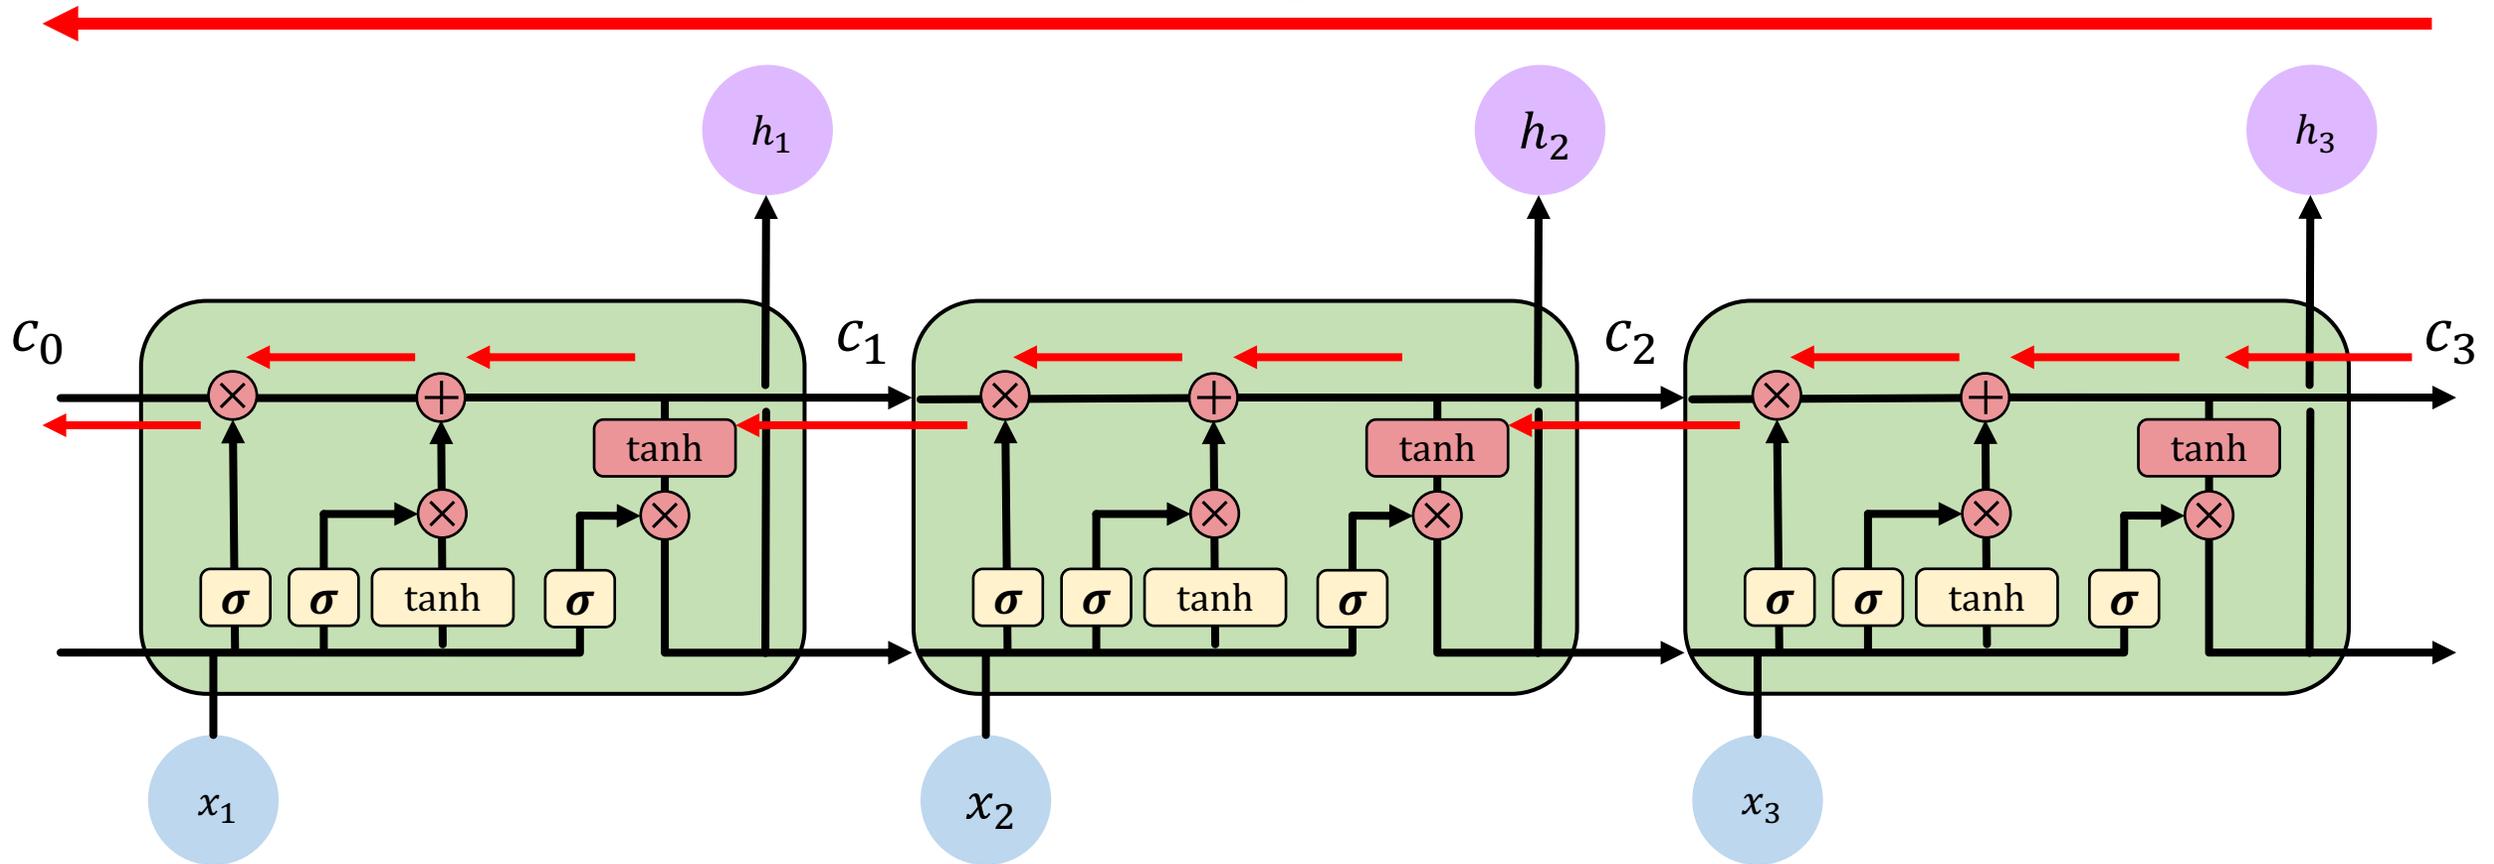

Backpropagation from  $C_t$  to  $C_{t-1}$  requires only elementwise multiplication!  
No matrix multiplication  $\rightarrow$  avoid vanishing gradient problem.

[2, 5]

# LSTM gradient flow

Uninterrupted gradient flow!

# LSTMs: key concepts

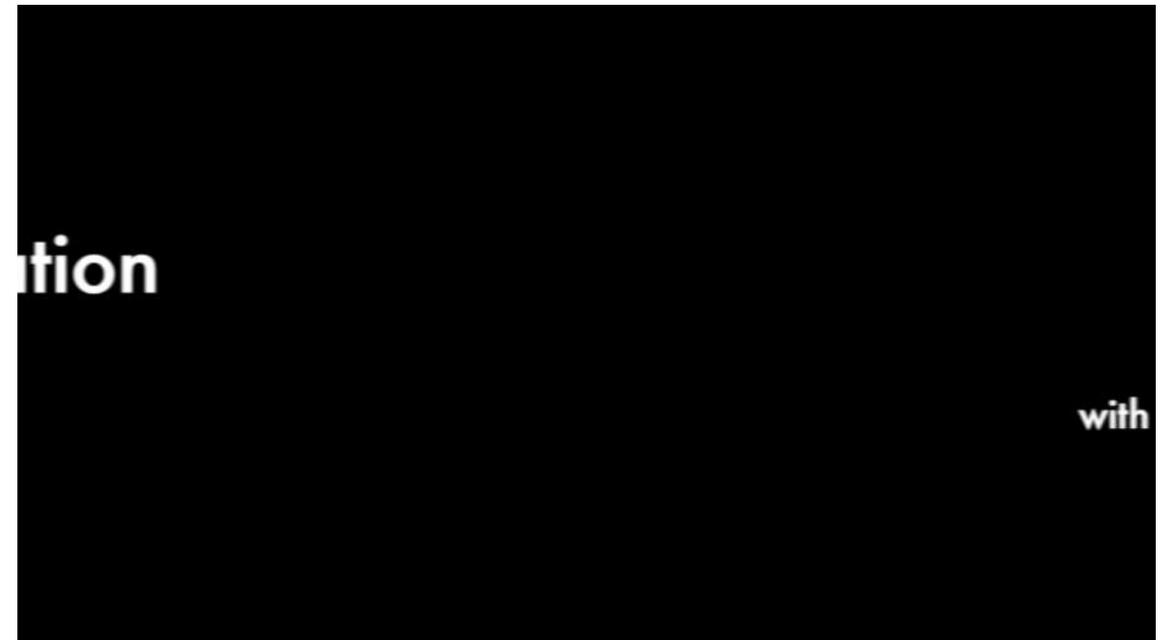

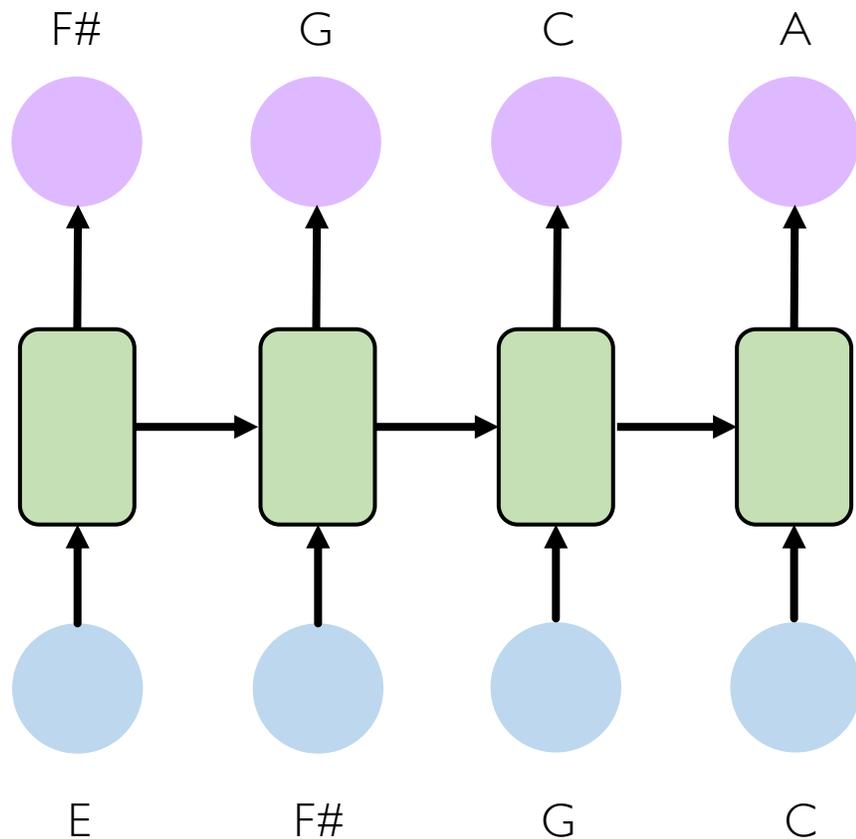

1. Maintain a **separate cell state** from what is outputted
2. Use **gates** to control the **flow of information**
  - Forget gate gets rid of irrelevant information
  - Selectively update cell state
  - Output gate returns a filtered version of the cell state
3. Backpropagation from  $c_t$  to  $c_{t-1}$  doesn't require matrix multiplication:  
**uninterrupted gradient flow**

# RNN Applications

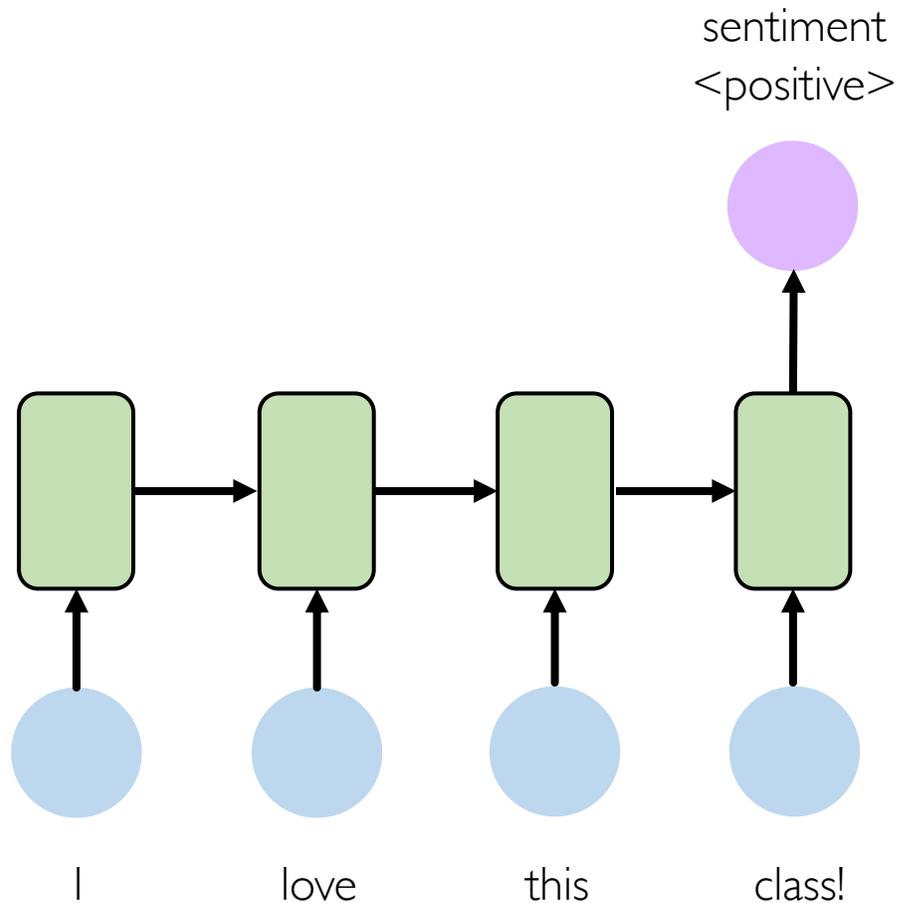

# Example task: music generation

**Input:** sheet music

**Output:** next character in sheet music

# Example task: sentiment classification

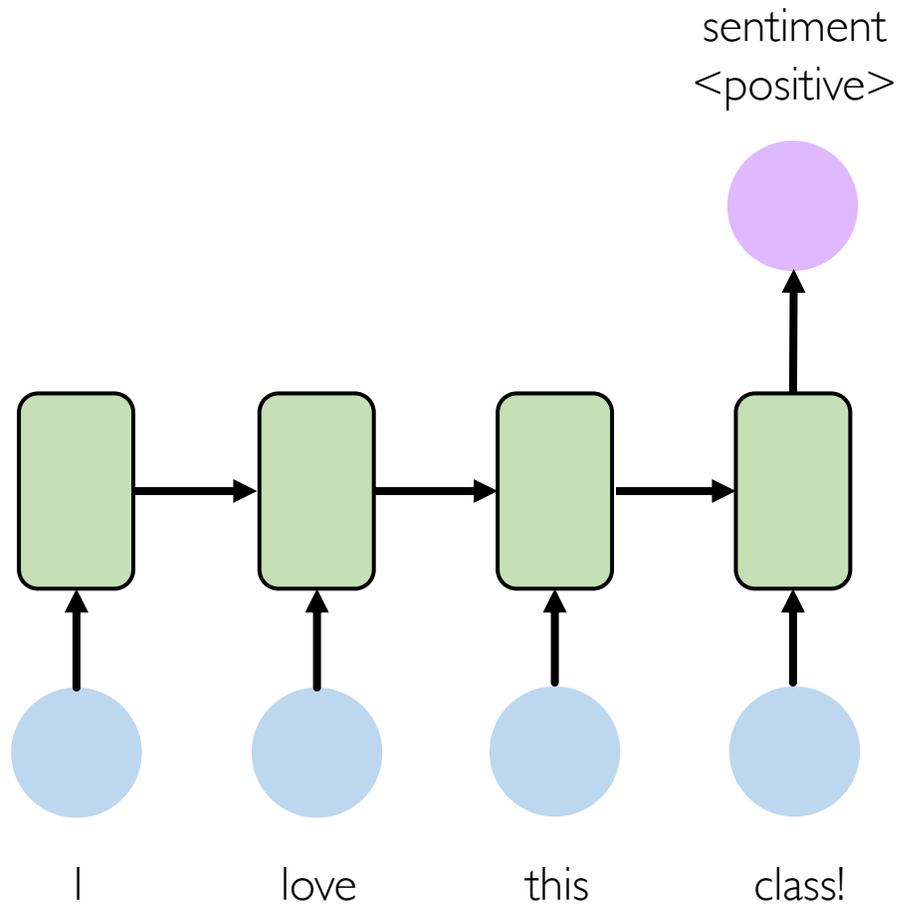

**Input:** sequence of words

**Output:** probability of having positive sentiment

```
loss = tf.nn.softmax_cross_entropy_with_logits(  
    labels=model.y, logits=model.pred  
)
```

# Example task: sentiment classification
